Abstract. In the current study, six species of the genus *Spinirta* from southern China are recognized, four new species are described: *S. hongyui* Wang, Lu & Z.S. Zhang sp. nov. (♂♀), *S. liuae* Wang, Lu & Z.S. Zhang sp. nov. (♂♀), *S. simianshan* Wang, Lu & Z.S. Zhang sp. nov. (♂♀) and *S. yintiaoling* Wang, Lu & Z.S. Zhang sp. nov. (♂). Females of *S. aviforma* Jin & Zhang, 2020 (♂♀) and *S. quadrata* Jin & Zhang, 2020 (♂♀) are described for the first time. Photos of the body and copulatory organs, as well as the locality map are provided.

Introduction

Corinnidae Karsch, 1880 comprises about 843 species in 74 genera, including 43 species in 10 genera recorded from China (WSC 2023). Currently, *Spinirta* Jin & Zhang, 2020 has 17 species with a wide range of distribution in southern China, including Anhui, Guangxi, Guizhou, Hunan, Hubei, Sichuan,

Jiangxi, Zhejiang Provinces and Chongqing. *Sipinirta* spiders live in a variety of habitats, ranging from deciduous layers, bamboo roots, thickets or canopies (Jin & Zhang 2020; Zhang *et al.* 2023).

While examining the corinnid spiders from southern China, we identified four new species from Guangdong, Yunnan Provinces and Chongqing City. This is the first time that the species of *Sipinirta* have been reported from Guangdong and Yunnan. In addition, the females of *S. aviforma* Jin & Zhang, 2020 and *S. quadrata* Jin & Zhang, 2020 are described here for the first time.

Material and methods

All specimens are preserved in 75% ethanol and were examined, illustrated, photographed and measured using a Leica M205A stereo microscope equipped with a drawing tube, a Leica DFC450 Camera and LAS software (ver. 4.6). Male pedipalps and epigynes were examined and illustrated after they were dissected. Female genitalia were cleared by immersing them in pancreatin (Álvarez-Padilla & Hormiga 2007). Eye sizes were measured as the maximum dorsal diameter. Leg measurements are shown as: total length (femur, patella and tibia, metatarsus, tarsus). All measurements are in millimeters.

Specimens examined here are deposited in the Collection of Spiders, School of Life Sciences, Southwest University, Chongqing, China (SWUC); type specimens of *Sipinirta aviforma* Jin & Zhang, 2020 are deposited at the Museum of Hebei University (MHBHU).

Differential diagnosis

Male of *Spinirta hongyui* Wang, Lu & Z.S. Zhang sp. nov. resembles *S. simianshan* Wang, Lu & Z.S. Zhang sp. nov. in having the similar tibial apophyses and somewhat quadrangular embolar apophysis (Figs 4A–B, 5F–G vs Figs 10A–B, 11F–G) but can be distinguished by the embolus tip with blunt end in *S. hongyui* (Figs 4A, 5F), vs retrolateral margin of embolus serrated in *S. simianshan* (Figs 10A, 11F); ventral margin of retrolateral tibial apophysis wavy in *S. hongyui* (Figs 4A, 5F), vs smooth, rounded in *S. simianshan* (Figs 10A, 11F). Female can be distinguished by the atrium septum indistinct in *S. hongyui* (Figs 4A, 5F), vs distinct, dividing atrium into two halves in *S. simianshan* (Figs 10A, 11F); copulatory opening present laterally in *S. hongyui* (Figs 4C, 5C), vs present posteriorly in *S. simianshan* (Figs 10C, 11C); accessory glands present in *S. hongyui* (Figs 4D, 5D), vs absent in *S. simianshan* (Figs 10D, 11D).

MEASUREMENTS. Total length 13.65. Prosoma 5.48 long, 4.37 wide; opisthosoma 7.49 long, 5.59 wide. Eye sizes and interdistances: AME 0.30, ALE 0.28, PME 0.30, PLE, 0.29; AME–AME 0.20, AME–ALE 0.14, PME–PME 0.33, PME–PLE 0.35, ALE–PLE 0.16. MOA 0.83 long, anterior width 0.82, posterior width 0.90. Clypeus height 0.31.

LEG MEASUREMENTS. I = 14.92 (4.31, 5.38, 3.21, 2.02); II = 14.17 (4.22, 4.90, 3.16, 1.89); III = 12.04 (3.57, 4.10, 2.79, 1.58); IV = 17.01 (4.70, 5.74, 4.71, 1.86). Leg formula: 4123.

EPIGYNE (Figs 8A, 9C). Atrium oval, wider than long, copulatory openings located posteriorly deep inside the atrium.

VULVA (Figs 8B, 9D). Copulatory ducts L-shaped, anterior margin partly membranous; accessory glands absent; spermathecae round; fertilization duct large, extending mesally.

Description

Male (holotype SWUC-T-CO-03-01, Fig. 11A)

MEASUREMENTS. Total length 18.13. Prosoma 8.88 long, 6.78 wide; opisthosoma 8.87 long, 5.31 wide. Eye sizes and interdistances: AME 0.62, ALE 0.44, PME 0.47, PLE 0.46; AME–AME 0.27, AME–ALE 0.15, PME–PME 0.51, PME–PLE 0.60, ALE–PLE 0.16. MOA 1.42 long, anterior width 1.36, posterior width 1.41. Clypeus height 0.59.

CHELICERAE. With three promarginal and five or six retromarginal teeth.

LEG MEASUREMENTS. I = 27.49 (7.69, 9.57, 6.48, 3.75); II = 26.13 (7.33, 9.14, 6.21, 3.45); III = 31.51 (5.73, 7.26, 5.46, 3.06); IV = 27.38 (7.05, 9.12, 8.32, 2.89). Leg formula: 1423.

Differential diagnosis

Male of *Sipinirta yintiaoling* Wang, Lu & Z.S. Zhang sp. nov. resembles *S. hongyui* sp. nov. in having the similar quadrangular embolar apophysis (Figs 12, 13B–D vs Figs 4A–B, 5F–G) but can be distinguished by the ventral tibial apophysis tip rounded in *S. yintiaoling* (Figs 12, 13B–D), whereas somewhat triangular in *S. hongyui* (Figs 4A–B, 5E–G); retrolateral tibial apophysis tip rounded in ventral view in *S. yintiaoling* (Figs 12, 13C–D), whereas wavy in *S. hongyui* (Figs 4A–B, 5F–G).

Discussion

Jin & Zhang (2020) established *Spinirta* to accommodate nine species and one new combination from Chongqing Municipality, Guizhou, Hubei, Hunan, Sichuan, and Zhejiang provinces. Until now, the distribution of the species of *Spinirta* has been documented in Sichuan, Chongqing, Hubei, Hunan, Anhui, Zhejiang, Guizhou, Guangxi, Jiangxi, and Fujian. However, this paper reports two new species of *Spinirta* for the first time from Guangdong and Yunnan provinces, indicating that the majority of the species live in mountainous areas of southern China. In order to obtain a more precise estimate of the actual number of species in *Spinirta*, it is still necessary to conduct an extensive survey in areas that have not yet been explored in southern China.
