Abstract. Twenty species of the genus *Chilocorus* Leach, 1815 currently known from China are recorded, including two new species described here: *C. nigricaeruleus* Li & Wang sp. nov. and *C. strenotubus* Li & Wang sp. nov. Diagnoses and detailed descriptions of the new species are given. Each species is illustrated in detail, including genitalia. Distribution maps, a key to the Chinese species and a world checklist of *Chilocorus* are given.

Keywords. Lady beetles, Chilocorini, new species, China, world checklist.

Li W., Huo L., Wang D., Ahrens D. & Wang X. 2018. Contribution to the genus *Chilocorus* Leach, 1815 (Coleoptera: Coccinellidae: Chilocorini), with descriptions of two new species from China. *European Journal of Taxonomy* 469: 1–34. https://doi.org/10.5852/ejt.2018.469

Introduction

The tribe Chilocorini Mulsant, 1846 belongs to the subfamily Chilocorinae along with the tribes Platynaspini Mulsant, 1846 and Telsimiini Casey, 1899 in the traditional classification, based on

the fact that they share a characteristic head capsule with a strongly expanded clypeus and reduced antennae (Sasaji 1968b). However, recent studies on the molecular phylogeny of Coccinellidae indicate that this subfamily is not a monophyletic group (Giorgi *et al.* 2009; Seago *et al.* 2011). As per the classification proposed by Ślipiński (2007) and Seago *et al.* (2011), Chilocorinae and its three tribes are now included in the subfamily Coccinellinae. Chilocorini has been identified as a sister group of Coccinellini (Magro *et al.* 2010; Seago *et al.* 2011; Escalona *et al.* 2017; Chen *et al.* 2017). At present, Chilocorini contains 27 genera and more than 280 species (Łączyński & Tomaszewska 2012; Li *et al.* 2017).

Chilocorus, the largest genus of the tribe Chilocorini, contains 79 species distributed all over the world and mainly preying on coccoidea (Giorgi *et al.* 2009; Escalona *et al.* 2017). Many species of *Chilocorus* are economically important as they are widely used as biological control agents (Ślipiński & Giorgi 2006), such as *Chilocorus nigrita* (Fabricius, 1798), which is widely distributed due to its deliberate introduction for biological control (Booth 1998). Leach (1815) established the genus *Chilocorus* for *Coccinella cacti* Linnaeus, 1767. Sicard (1920) proposed a subgenus *C.* (*Trichocorus*) for two species, this was supported by Chapin (1965) who considered *Chilocorus* as a non-monophyletic genus. This concept was accepted by Miyatake (1970), who studied East-Asian species, and subdivided *Chilocorus* into seven groups depending on the characters of pronotal oblique line, prosternal process, prosternal hypomeral foveae, elytral epipleural foveae, elytral outer margin, etc. The phylogenetic relationships of *Chilocorus* are still unclear. There are no detailed phylogenetic analyses based on morphology and Chilocorini are poorly represented in the molecular studies dealing with Coccinellidae.

The species of *Chilocorus* are abundant in China and prior to the present study, 18 were known (Liu 1963; Pang & Mao 1979; Cao & Xiao 1984; Pang *et al.* 2004; Ren *et al.* 2009). However, no comprehensive revision of Chinese *Chilocorus* has been carried out over the last 40 years. Furthermore, the world checklist of *Chilocorus* has not been updated for several decades since Korschefsky (1932), who provided the world checklist of Coccinellidae. The present paper aims at updating the knowledge of Chinese *Chilocorus*, including two new species, and provides a checklist of the known species of the world.

Material and methods

Specimens examined in this study were collected from China and Nepal. Type specimens of the new species are deposited at the Department of Entomology, South China Agriculture University, Guangzhou. Other material examined is deposited in the following research institutions:

SCAU = South China Agriculture University, Guangzhou, China
FIQB = The Forest Inspection and Quarantine Bureau, Yunnan, China
NCHU = National Chung Hsing University, Taiwan, China

External morphology was observed with a dissecting stereo microscope (SteREO Discovery V20, Zeiss). Male and female genitalia were dissected, cleared in a 10% solution of NaOH by boiling for several minutes and examined with an Olympus BX51 microscope. The photographs of genitalia and other morphological characters were generated with digital cameras (AxioCam HRc and Coolsnap-Procf & CRI Micro*Color), attached to microscopes using AxioVision Rel. ver. 4.8 and Image-Pro Plus ver. 6.0 to capture images, and photographs were cleaned up and laid out in plates with Adobe Photoshop CS ver. 8.0. Terminology follows Ślipiński (2007) and Ślipiński & Tomaszewska (2010).

Abbreviations

TL = total length, length from apical margin of clypeus to apex of elytra
TW = total width, width across both elytra at widest part
TH = height measured across the highest point of the elytra

HW = head width in a frontal view
PL = pronotal length, from middle of anterior margin to base of pronotum
PW = pronotal width at widest part
EL = elytral length, from apex to base including scutellum
EW = elytral width, equal to TW

Results

Superfamily Coccinelloidea Latreille, 1807
Family Coccinellidae Latreille, 1807
Subfamily Coccinellinae Latreille, 1807
Tribe Chilocorini Mulsant, 1846

Genus ***Chilocorus*** Leach, 1815

Chilocorus Leach, 1815: 116.

Type species

Coccinella cacti Linnaeus, 1767, by monotypy.

Diagnosis

The genus *Chilocorus* can be distinguished from the other genera of the tribe Chilocorini by the following characters: body with dorsum glabrous, rarely with pubescence; outer elytral margin slightly reflexed, without distinct bead; antenna stout, composed of 8 antennomeres (Fig. 3e); terminal maxillary palpomere elongate, from 1 to 2 times as long as basal width, with sides nearly parallel or moderately expanded to apex (Fig. 3f); prosternal process long, narrow and subparallel without carina; legs with stout femora, tibiae with a triangular tooth at basal ⅓, without tibial spurs (Fig. 3i–j); tarsal claws stout, with approximately rectangular basal tooth, about ½ length of claw (Fig. 3k).

Description

Body. Broadly oval or roundish, hemispherical and strongly convex. Dorsum glabrous, rarely pubescent. Head relatively large, 0.50–0.65 times pronotal width, covered with short, greyish pubescence; antenna composed of eight antennomeres, relatively stout, scape asymmetrical, scape and pedicel subequal in length and width, antennomeres 3–7 gradually broadening and elongated, antennomere 8 subconical, distinctly longer than antennomere 7 (Fig. 3e). Mandible unidentate, prostheca indistinct, lateral margin of mandible strongly curved (Fig. 3g). Terminal maxillary palpomere elongate with sides nearly parallel or expanded to apex, rarely subquadrate, apical margin obliquely truncate (Fig. 3f). Terminal labial palpomere subconical (Fig. 3h).

Prothorax. Descending anteriorly. Prosternum T-shaped, in front of coxae distinctly longer than basal width of prosternal process. Prosternal process moderately broad, subparallel or slightly expanded to apex, truncate at apex, without carinae (Fig. 3d). Mesoventrite approximately trapezoidal, anterior margin of mesoventrite straight. Meso-metaventral process narrow, junction straight, with visible suture. Scutellum small and triangular. Elytra distinctly wider than pronotum at base, surface finely or coarsely punctate. Elytral epipleura distinctly oblique, with or without grooves. Abdomen with five ventrites in female and six ventrites in male. Abdominal postcoxal lines incomplete, not curved, posteriorly reaching or very close to hind margin of ventrite. Legs with stout femora, tibiae with a triangular tooth at basal ⅓, without tibial spurs (Fig. 3i–j); tarsal claw with basal tooth (Fig. 3k).

Key to species of the genus **Chilocorus** *from China*

1. Elytra without spots 2
– Elytra with spots 11

2. Elytra entirely black or outer margin black 3
– Elytra entirely red (Fig. 1a) ..... ***C. politus*** Mulsant, 1850

3. Elytra entirely black 4
– Only outer margin of elytra black 7

4. Body round 5
– Body heart-shaped (Fig. 2a) ..... ***C. yunlongensis*** Cao & Xiao, 1984

5. Dorsum without metallic lustre 6
– Dorsum with bluish lustre (Fig. 3a) ..... ***C. nigricaeruleus*** Li & Wang sp. nov.

6. Pronotum mostly black except lateral parts yellow (Fig. 4c) ..... ***C. nigrita*** (Fabricius, 1798)
– Pronotum black except anterior angles yellow (Fig. 5c) ..... ***C. melas*** Weise, 1898

7. Ground colour of elytra red 8
– Ground colour of elytra yellow 10

8. Body roundish 9
– Body heart-shaped (Fig. 6a ..... ***C. rubidus*** Hope, 1831

9. Scutellum black (Fig. 7a–c); abdominal postcoxal line not reaching posterior margin of abdominal ventrite 1 (Fig. 7d) ..... ***C. chinensis*** Miyatake, 1970
– Scutellum red (Fig. 8a–c); abdominal postcoxal line reaching posterior margin of abdominal ventrite 1 (Fig. 8d) ..... ***C. rufitarsis*** Motschulsky, 1853

10. Head black, pronotum and outer margin of elytra black with bluish lustre (Fig. 9a–c) ..... ***C. hauseri*** Weise, 1895
– Head and pronotum yellow, outer margin of elytra black without bluish lustre (Fig. 10a–c) ..... ***C. circumdatus*** (Gyllenhal, 1808)

11. Elytra with a pair of spots 12
– Elytra with two or three pairs of spots 17

12. Black areas of dorsum with bluish lustre 13
– Black areas of dorsum without any metallic lustre 14

13. Penis guide as long as parameres (Fig. 11h) ..... ***C. chalybeatus*** Gorham, 1892
– Penis guide distinctly shorter than parameres (Fig. 12g) ..... ***C. shirozui*** Sasaji, 1968

14. Elytral spots small, apex of penis blunt 15
– Elytral spots relatively larger, penis constricted to a pointed tip (Fig. 13a, e–f) ..... ***C. hupehanus*** Miyatake, 1970

15. Penis and tegmen moderately stout 16
– Penis and tegmen strongly stout, penis guide subtriangular, widest at base, gradually converging apically to blunted tip in ventral view (Fig. 14e, h) ..... ***C. strenotubus*** Li & Wang sp. nov.

16. Penis guide approximately ⅔ length of parameres in lateral view, distinctly expanded at basal ¼ in ventral view (Fig. 15g–h) ..... ***C. kuwanae*** Silvestri, 1909

– Penis guide approximately ⅘ length of parameres in lateral view, approximately parallel from base to basal ½ (Fig. 16g–h) ..... ***C. esakii*** Kamiya, 1959

17. Ground colour of elytra black 18
– Ground colour of elytra brown 19

18. Body length: 3.40–3.70 mm, broadly oval, dorsum with bluish lustre (Fig. 17a) ..... ***C. alishanus*** Sasaji, 1968
– Body length: 4.30–5.30 mm, heart-shaped, dorsum without any metallic lustre (Fig. 18a) ..... ***C. bijugus*** Mulsant, 1853

19. Body length: 3.33–3.67 mm, elytra dark brown, with three pairs of roundish yellow spots, arranged in a row before centre, penis guide as long as parameres (Fig. 19a, g) ..... ***C. bipustulatus*** (Linnaeus, 1758)
– Body length: 3.80–4.67 mm, elytra dark brown, with a pair of transverse yellow strips, situated before centre, about ⅔ elytra width, penis guide slightly longer than parameres (Fig. 20a, g) ..... ***C. geminus*** Zaslavskij, 1962

Chilocorus nigricaeruleus Li & Wang sp. nov.
urn:lsid:zoobank.org:act:AD963BB9-B700-4984-BE32-C9AFAFFE15D1
Figs 3, 21

Diagnosis

This species resembles *Chilocorus melas* Weise, 1898, but can be distinguished from it by having relatively large black body with dorsum with bluish lustre (Fig. 3a) and equal length of penis guide and parameres (Fig. 3o). In *C. melas*, the body is relatively small, dorsum black (Fig. 5a) and the penis guide distinctly longer than parameres (Fig. 5g).

Etymology

The specific epithet is derived from the Latin and refers to the colour of the elytra and pronotum, black with a bluish lustre.

Type material

Holotype

CHINA: ♂, Yunnan Prov., Longtan, Ximeng, 900 m a.s.l., 9–10 May 2008, X.M. Wang leg. (SCAU (E) 11287).

Paratypes

CHINA: 1 ♂, same collection data as for holotype (SCAU (E) 11288).

Description (male)

Measurements. TL: 4.40–4.67 mm, TW: 4.00–4.33 mm, TH: 2.33–2.40 mm, TL/TW: 1.08–1.10, PL/PW: 0.48–0.51, EL/EW: 0.98–0.99.

Body. Roundish, strongly convex. Head, antenna and mouthparts yellow, sparsely covered with short, greyish pubescence. Pronotum black with bluish lustre, except anterior angles yellow. Scutellum and elytra black with bluish lustre (Fig. 3a–c). Underside yellow except elytral epipleura black, metaventrite brownish yellow, sparsely covered with short, greyish pubescence. Head relatively large, 0.52 × as wide as pronotum, punctures on frons large and densely distributed, 1.0–2.0 diameters apart, surface polished between punctures. Eyes approximately oval, densely faceted, interocular distance 0.41 × as wide as head (Fig. 3c). Pronotum 0.51 × as wide as elytra, pronotal punctures moderately large and moderately densely distributed, smaller than those on head, 2.0–3.0 diameters apart, surface polished between punctures. Punctures on elytra moderately large and sparsely distributed, 2.0–4.0 diameters apart, similar to those on pronotum. Prosternal process moderate broad, slightly expanded to apex. Abdominal postcoxal lines incomplete, reaching posterior margin of abdominal ventrite 1 and running along posterior margin, then almost reaching lateral margin. Posterior margin of male abdominal ventrite 5 broadly rounded and ventrite 6 emarginate medially (Fig. 3l).

Male genitalia. Penis slender, penis capsule with long outer and inner arms, apex of penis slightly narrow with membranous appendage (Fig. 3m–n). Tegmen stout, penis guide widest at basal ⅓, then gradually converging to blunt apex, distinctly asymmetrical in ventral view and widest at base, gradually converging to blunt apex, bent outwardly from apical ⅙ to apex in lateral view. Parameres constricted from base to basal ½ than expanded toward apex, as long as penis guide, densely covered with short setae at the inner surfaces and distal end in lateral view (Fig. 3o–p).

Distribution

China (Yunnan) (Fig. 21).

China (Zhejiang, Fujian, Shandong, Hubei, Hunan, Sichuan, Guizhou, Guangdong, Guangxi, Gansu) (Fig. 22).

Chilocorus strenotubus Li & Wang sp. nov.
urn:lsid:zoobank.org:act:9258A913-6BF6-419B-812E-C80707513E96
Figs 14, 22

Diagnosis

This species is similar to *C. kuwanae* Silvestri, 1909 in the shape of the body, but can be distinguished from it by the male genitalia: penis strongly stout (Fig. 14e); tegmen strongly stout with penis guide subtriangular, widest at base, gradually converging apically to blunted tip in ventral view (Fig. 14h).

Etymology

The specific epithet is derived from Latin and refers to the stout penis.

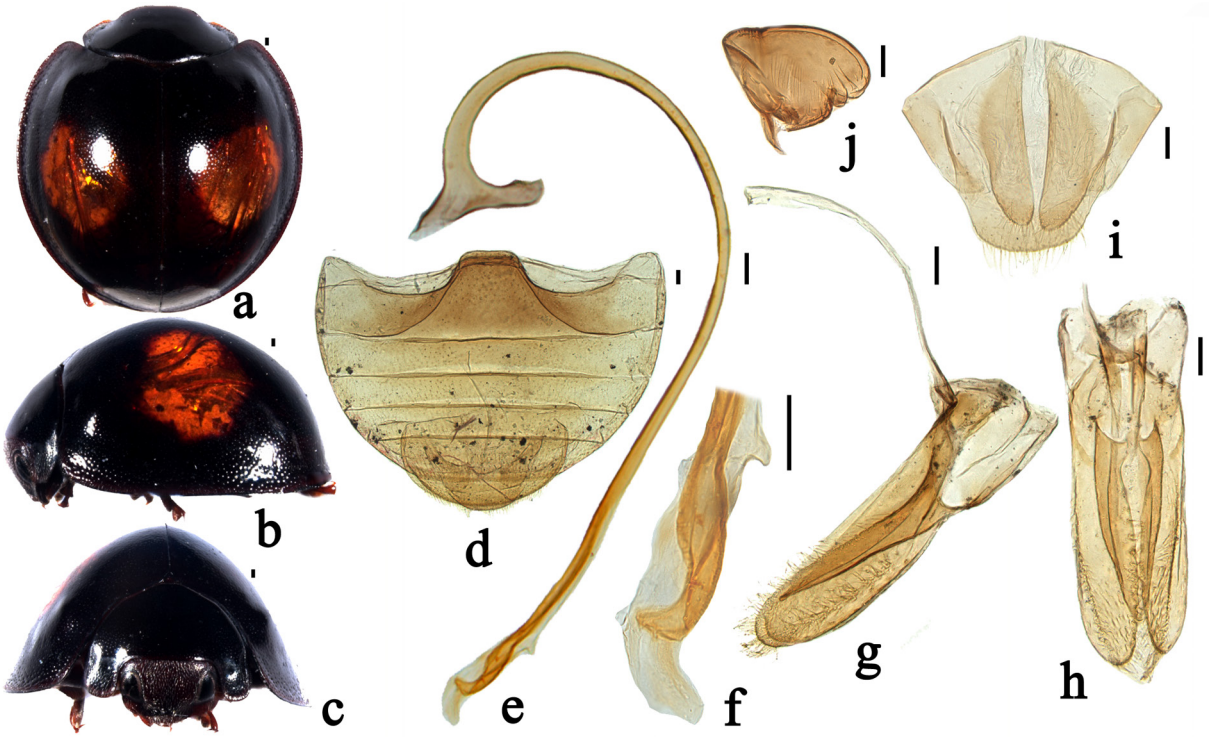

Fig. 13. *Chilocorus hupehanus* Miyatake, 1970. **a**. Dorsal view. **b**. Lateral view. **c**. Frontal view. **d**. Abdomen. **e**. Penis. **f**. Apex of penis. **g**. Tegmen, lateral view. **h**. Tegmen, ventral view. **i–j**. Female genitalia. **i**. Ovipositor. **j**. Spermatheca. Scale bars: 0.1 mm. (SCAU)

Type material

Holotype

CHINA: ♂, Inner Mongolia, Youyizhongqi, Keerqin, 19 Aug. 2009, S.X. Ren leg. (SCAU (E) 11037).

Description (male)

Measurements. TL: 3.41 mm, TW: 2.93 mm, TH: 1.77 mm, TL/TW: 1.16, PL/PW: 0.51, EL/EW: 1.02.

Body. Roundish, strongly convex. Head, antenna and mouthparts brown-black, sparsely covered with short, greyish pubescence. Pronotum and scutellum black. Elytra black with a pair of oblong, orange spots, situated at centre, about ½ elytra width (Fig. 14a–c). Underside black except abdomen brown, sparsely covered with short, greyish pubescence. Head relatively large, 0.60 × as wide as pronotum, punctures on frons large and densely distributed, 1.0–2.0 diameters apart, surface polished between punctures. Eyes subtriangular, densely faceted, interocular distance 0.55 × as wide as head (Fig. 14c). Pronotum 0.59 × as wide as elytra, pronotal punctures moderately large and sparsely distributed, smaller than those on head, 2.0–3.5 diameters apart, surface polished between punctures. Punctures on elytra fine and sparsely distributed, 3.0–4.0 diameters apart, smaller than those on pronotum. Prosternal process moderate broad, slightly expanded to apex. Abdominal postcoxal lines incomplete, reaching posterior margin of abdominal ventrite 1 and running along posterior margin and almost reaching lateral margin. Posterior margin of male abdominal ventrite 5 truncate and 6 broadly rounded (Fig. 14d).

Male genitalia. Penis stout and simple, penis capsule with short outer arms and long inner arms, apex of penis truncate and membranous around at ⅓ to apex (Fig. 14e–f). Tegmen distinctly stout with penis guide subtriangular, widest at base, gradually converging to blunt apex in ventral view and widest at base, gradually converging to blunt apex in lateral view. Parameres distinctly longer than penis guide

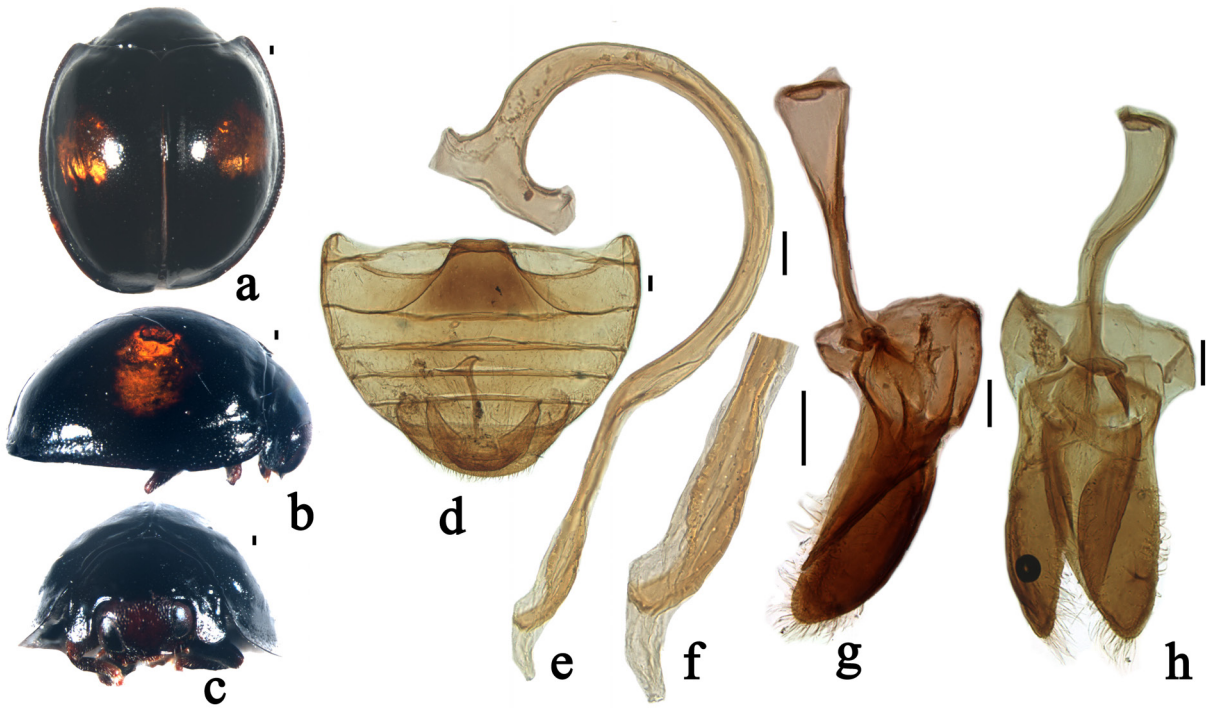

Fig. 14. *Chilocorus strenotubus* Li & Wang sp. nov., holotype **a**. Dorsal view. **b**. Lateral view. **c**. Frontal view. **d**. Abdomen. **e**. Penis. **f**. Apex of penis. **g**. Tegmen, lateral view. **h**. Tegmen, ventral view. Scale bars: 0.1 mm. (SCAU (E) 11037)

with densely covered with long setae at the inner sides and distal end with a group of long setae in lateral view (Fig. 14g–h).

Distribution

China (Inner Mongolia) (Fig. 22).

Discussion

The morphological characters of the genus *Chilocorus* are relatively heterogeneous at species level. Chapin (1965) and Miyatake (1970) thought that it should be further subdivided. However, four genera in Chilocorini, *Phaenochilus* Weise, 1895 distributed in Oriental region, *Simmondsius* Ahmad & Ghani,1966 distributed in Pakistan, *Anisorcus* Crotch, 1874 distributed in Australian region and *Egius* Mulsant, 1850 distributed in Cuba, are very similar to *Chilocorus* in morphological characters. A more detailed analysis of the phylogeny of the genera of Chilocorini is needed to reveal the relationships between the five groups and determine whether *Chilocorus* is a natural group.

Acknowledgements

We are particularly grateful to Wioletta Tomaszewska (Museum and Institute of Zoology PAS, Warsaw, Poland) and Michael Geiser (Natural History Museum, London, UK) for their kind help during Wenjing Li's visit to the museums. We are grateful to Shaukat Ali (South China Agriculture University, Guangzhou, China) for checking a draft of this paper. This research was supported by the National Natural Science Foundation of China (31501884), Science and Technology Partnership Program, Ministry of Science and Technology of China (KY201402014) and Science and Technology Program of Guangzhou, China (201509010023).
