Abstract. The African shieldbug genus *Afrius* Stål, 1870 is revised. *Cantheconidea migratoria* Distant, 1913 and *A. williamsi* Miller, 1952 are proposed as junior synonyms of *A. (Subafrius) flavirostrum* (Signoret, 1861) whereas *Canthecona marmorata* Dallas, 1851, *Canthecona annulipes* Dallas, 1851 and *A. rubromarginatus* Bergroth, 1903 are proposed as junior synonyms of *A. (Afrius) purpureus* (Westwood, 1837) based on the general morphology and genitalia of the species. The three valid species, viz. *A. (Subafrius) flavirostrum*, *A. (Afrius) kollerii* Schouteden, 1911 and *A. (Afrius) purpureus*, are redescribed with details of male and female genitalia morphology, and a lectotype is designated for *A. (Afrius) kollerii*. A key to identify the species as well as an update of the geographical distribution for each species are provided, including new records for *A. (Afrius) purpureus*.

Keywords. Stink bugs, predation, taxonomy, polymorphism, Ethiopia.

Roell T., Lemaître V.A. & Webb M.D. 2019. Revision of the African shieldbug genus *Afrius* Stål, 1870 (Hemiptera: Pentatomidae: Asopinae). *European Journal of Taxonomy* 520: 1–44.
<https://doi.org/10.5852/ejt.2019.520>

Introduction

The subfamily Asopinae is the only predatory subfamily of Pentatomidae. It is an important economic group, containing many species used as biological control agents for pest management (Grazia *et al.* 2015). The asopines have a worldwide distribution and are recognized mainly by the robust labium and, in the male genitalia, by the presence of genital plates and a thecal shield (Thomas 1992, 1994). The asopine genus *Afrius* Stål, 1870 is distributed throughout Africa and its species have been considered potential biological control agents for insects injurious to plantations in different regions of Africa (e.g., Miller 1952; Sileshi *et al.* 2004). *Afrius* was created as a subgenus of *Cimex* Linnaeus, 1758

by Stål (1870) with three species, *Cimex (Afrius) figuratus* (Germar, 1838), *C. (Afrius) purpureus* (Westwood, 1837) and *C. (Afrius) flavirostris* (Signoret, 1861), characterized within the inclusive genus by abdominal lateral margins convex and anterior femora armed with spines. In his synopsis of the Old World asopine genera, Thomas (1994) presented a diagnosis of the genus and mentioned the lack of a species identification key and the necessity of revisionary studies on the genus. After examining type and other material of all species, we here provide a revision of the genus, with habitus and genitalia figures and descriptions of each species, new synonymies and new records.

Material and methods

Type and other material were examined and photographed at The Natural History Museum, London, UK (NHMUK), the Musée royal de l'Afrique centrale, Belgium (RMCA), the Museum für Naturkunde Berlin, Germany (MFNB), the Muséum national d'Histoire naturelle, Paris, France (MNHN), the University Museum of Natural History in Oxford, UK (OUMNH), and the Federal University of Rio Grande do Sul, Porto Alegre, Brazil (UFRG). Extra material was received from the American Museum of Natural History, USA (AMNH), David A. Rider Collection, USA (DARC), the Entomologisches Museum - Insekten Dauerausstellung, Geyer, Germany, and the National Museum of Prague, Czech Republic (NMPC). Photographs were received from the Naturhistorisches Museum Wien, Austria (NHW), and the Naturhistoriska Riksmuseet, Stockholm, Sweden (NHR). The examined material is listed in Table 1, and the geographic coordinates in decimal degrees were taken from the Google Earth program (ver. 7: <https://www.google.com/earth/>) and from the 'GeoNames' website (<http://www.geonames.org>) when

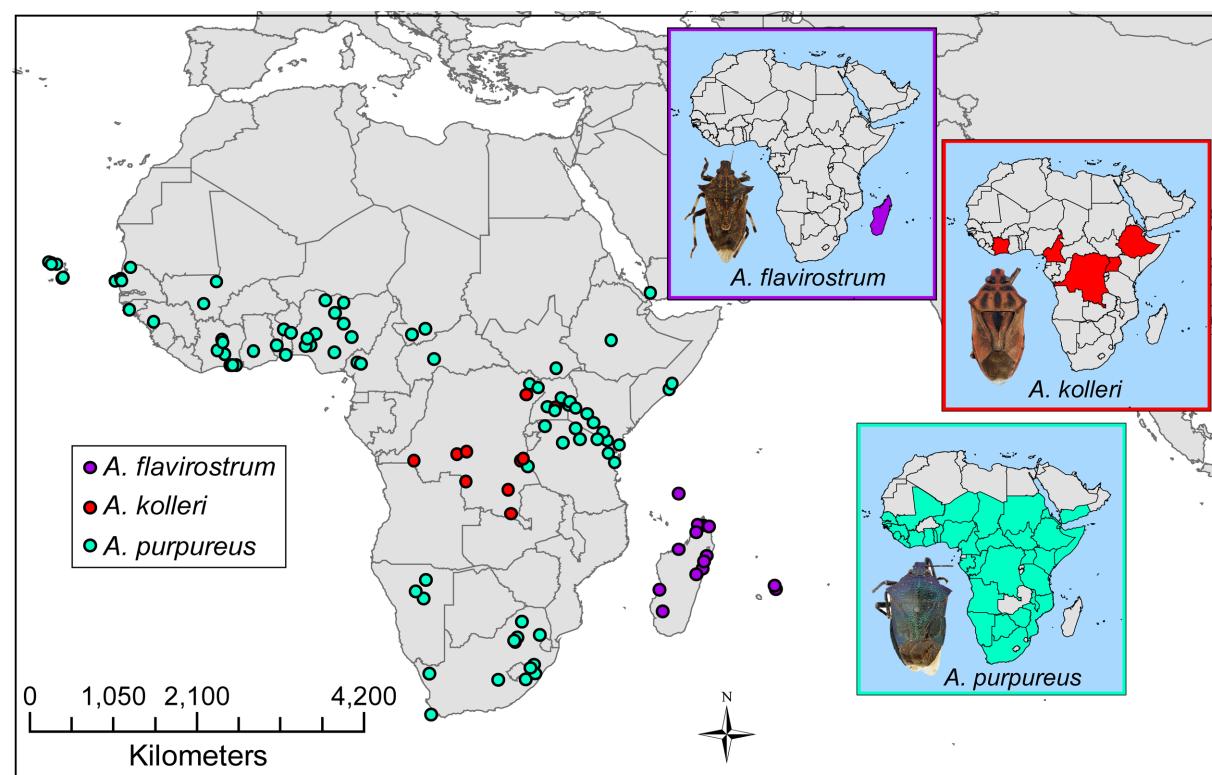

Fig. 1. Geographic distribution of the genus *Afrius* Stål, 1870 throughout Africa. The species points of occurrence and their dispersion in different countries are represented with colours: purple = *A. (Subafrius) flavirostrum* (Signoret, 1861); red = *A. (Afrius) kollerii* Schouteden, 1911; green = *A. (Afrius) purpureus* (Westwood, 1837). The countries highlighted for each species on the right part of the map are based on data from literature. The points marked for each species are from literature and labels information.

Table 1. (continued on next 7 pages) Geographic distribution and material examined of the species of *Afrius* Stål, 1870. The data are taken from literature or labels of the examined material. New collection sites located in previously registered countries are referred to as “new locality”, whereas new collection sites located in also newly registered countries are referred to as “new record”.

					Hilgert (1908) listed specimens in provenance of Karaju [am Mane, often as Land d'Gurra and once as Arussi-Gallaland], collected in the period (21–27 March 1901, mostly on the 23 rd). Schouteden had reported specimens from Koridjalu, collected on 22–23 March 1901. Whether Karaju and Koridjalu are one and the same locality, it is safe to assume that Erdanger collected along the Mena River in March 1901, this places Karaju/Koridjalu in Ethiopia, in the Oromiya region.

Table 1. (continued)

Locality	Latitude	Longitude	Material examined Collection	Observations
Niam-Niam (Congo)				Schouteden 1905a. The land of the Niam-Niam [Zande] people was a vast area, now corresponding to parts of the Democratic Republic of the Congo, South Sudan and Central African Republic. Since Schouteden (1905b) listed it under Congo, we may assume that he was referring more specifically to an area in the northeast of the Democratic Republic of the Congo, probably the Uele and Ituri Provinces, from where Schouteden (1972) reported the species.
Oriental Africa		Bergroth 1903; Schouteden 1905a		syntype of <i>Afrius rubromarginatus</i> . A handwritten label reads “Probably TANGANYIKA” and it could be so, but we can’t help noticing that the green disc label reads “Afriq Or”, clearly an abbreviation of the French “Afrique orientale”. It could be because the specimen was labelled and/or examined in Belgium (Bergroth published the original description of <i>A. rubromarginatus</i> in the <i>Annales de la Société entomologique de Belgique</i>), but it could also mean that the specimen was collected in French East Africa, the only mainland country of which was what is now the Republic of Djibouti, from where a record for this species was newly reported by Maldès & Pluot-Sigwalt in 2004. Interestingly, Kirkaldy (1909) catalogued “German East Africa” (including present-day Burundi, Rwanda, and the mainland part of Tanzania) for <i>A. rubromarginatus</i> .

Table 2. Terminology of male genitalia from Singh-Pruthi 1925; Baker 1931; Dupuis 1955, 1970; Konstantinov & Gapon 2005 and Gapon & Konstantinov 2006.

	Singh-Pruthi 1925	Baker 1931	Dupuis 1955, 1970	Konstantinov & Gapon 2005, Gapon & Konstantinov 2006
External genitalia	segment IX	genital segment ventral and dorsal borders	pygophore or genital capsule	pygophore
	—	genital plates	processus supérieurs	—

	ejaculatory duct		ductus seminis	seminal duct + vesica
	gonophore	—	secondary gonopore	secondary gonopore
	conjunctiva	—	conjunctiva	conjunctiva
	ejaculatory reservoir	—	ejaculatory reservoir	ejaculatory reservoir

the labels or literature information had sufficient data. The map for the distributional records of species of *Afrius* (Fig. 1) was made using the ArcGIS Desktop program (ver. 10.4.1: <http://desktop.arcgis.com>). To understand how the old regions of Africa overlapped with current countries, we consulted the ‘rare maps’ website (<https://www.raremaps.com>).

Measurements in millimeters [mean ± standard deviation (minimum and maximum values found among all specimens measured)] are given for the total length; length and width of the head, pronotum, scutellum and abdomen; and length of the antennal and labial segments. Genitalia were prepared with heated 10% KOH aqueous solution. The terminology of Singh-Pruthi (1925), Baker (1931), Dupuis (1955, 1970), Konstantinov & Gapon (2005) and Gapon & Konstantinov (2006) was adopted for genitalic structures; a correspondence between different terms used for the male genitalia by these authors is given in Table 2. We follow the terminology of Kment & Vilímová (2010) for the external scent efferent system of the metathoracic gland. Drawings were carried out under a stereo microscope coupled with a camera lucida and edited with a vectorial image processor.

 Subfamily Asopinae Spinola, 1850

Afrius Stål, 1870

Cimex (Afrius) Stål, 1870: 44. Type species by subsequent designation (Schouteden 1907a: 51): *Asopus figuratus* Germar, 1838 (= *Afrius purpureus* (Westwood, 1837)).

Afrius – Lethierry & Severin 1893: 214. — Schouteden 1907a: 50–52; 1909: 64; 1972: 106. — Kirkaldy 1909: 10. — Cachan 1952: 305. — Villiers 1952b: 81. — Mamet 1957: 34. — Gillon 1972: 351–352. — Thomas 1994: 150–152. — Maldès & Pluot-Sigwalt 2004: 20. — Rider 2006: 234. — Robertson 2009: 20–23.

Diagnosis

Lateral pronotal margins sinuous and crenulated on anterior half; frenal margin of scutellum longer than postfrenal part; abdominal basal tubercle short, not extending beyond metacoxae; profemur with a preapical spine; protibia very slightly expanded; male abdomen with or without ventral setose patches on segments V and VI; posterior angles of seventh abdominal segment obtuse (Fig. 8C, paVII); metapleural evaporatorium thinly surrounding peritreme.

Redescription

BODY LENGTH. 8.70–13.22 mm (♀♀) and 9.00–11.00 (♂♂).

BODY. Oval or pentagonal, with variable colour patterns.

HEAD. Uniformly punctured, mandibular plates varying from equal to a little shorter or little longer than clypeus, with margins straight to slightly sinuous; ocelli placed close to an imaginary line connecting posterior margin of eyes; antenna with five antennomeres bearing thin setae, denser on fourth and fifth antennomeres; antennal tubercles partially visible from above, acute apically; bucculae rounded; labium robust, extending to posterior margin of metasternum.

THORAX. Pronotum hexagonal, uniformly punctured except on cicatrices; anterior margin concave; lateral margins sinuous, crenulated on anterior half; posterior angles with a prominent small spine; a thin central line without punctures forms a weak longitudinal medial carina that extends from anterior to posterior margin. Scutellum reaching an imaginary line connecting middle of each connexival segment V; a thin central line without punctures also forms a weak longitudinal medial carina, connected with a similar line on pronotum from anterior to posterior margins; frenal margins longer than postfrenal margins. Corium longer than scutellum, uniformly punctured, membrane surpassing apex of abdomen. Pro-, meso- and metasterna covered by small thin setae; prosternum lighter, with a weak median carina; mesosternum black between pro- and mesocoxae, slightly punctured, with central parallel horizontal stripes, and with a median light wide, rectangular and elevated carina, wider anteriorly; metasternum flat or slightly elevated. Metapleural evaporatorium narrowly surrounding peritreme, narrowly extending on posterior meso- and anterior metapleural margins, also extending to anterior angle of mesopleura. Peritreme disc: ostiolar opening laterally directed. Profemur with anteapical spine, protibia slightly expanded, meso- and metatibiae prismatic.

ABDOMEN. Sparsely punctured, punctures less dense on disc, short basal tubercle anteriorly directed. Trichobothria aligned to an imaginary line connecting middle of spiracles. Posterolateral angles of abdominal sternites rounded.

Male

ABDOMEN. With or without ventral setose patches on segments V and VI.

GENITALIA. Pygophore bowl-shaped, with setae on entire surface, denser between ventral border and inferior layer of ventral border, and on apex of posterolateral angles (Figs 3, 6, 10 A–F); dorsal border concave, weakly medially elevated (Figs 3, 6, 10 A, D, db); ventral border slightly concave (Figs 3, 6, 10, B, E, vb), medially emarginated in posterior view (Figs 3, 6, 10, C, F, vb), inferior layer slightly excavated (Figs 3, 6, 10, B–C, E–F, il). Posterolateral angles rounded, setose on apex (Figs 3, 6, 10, A–F, pa). Segment X tubular, ventrally directed, dorsally sclerotized, medially carinated, setose, setae denser on apex (Figs 3, 6, 10, A, C–D, F, X). Genital plates between lateral walls of capsule and parameres (Figs 3, 6, 10, A, C–D, F, I, gp). Phallus. Phallotheca divided in a globose basal theca and a cup-like thecal shield (Figs 3 J–Q, 6 J–R, 10 J–R, ph, bt, ts). Ejaculatory reservoir contained inside basal theca (Figs 3 J–N, 6 J–O, 10 J–O, er). Basal foramen circular, reinforced by basal plates (Figs 3 L, N, 6 L, O, 10 L, O, bf, bp). Vesica partially inserted in phallotheca, golf club-shaped in lateral view, bearing two elongated filaments and a central elevated portion with microsculptures (Figs 3 J–Q, 6 J–R, 10 J–R, v); ductus seminis running between filaments of vesica, ending on a secondary gonopore, dorsally directed (Figs 3J–Q, 6J–R, 10J–R, ds, sg). Conjunctival lobes paired, posteriorly directed, globose, with apices endowed with a set of small sculptured processes (Figs 3J–P, 6J–P, 10J–Q, cl, sp).

Female

GENITALIA. Gonocoxites VIII subtriangular, posterior margins sinuous, sutural margins straight, juxtaposed, setae on posterior and sutural margins (Figs 4, 7, 11, A–B, gcVIII). Laterotergites VIII triangular, longer than wide, with spiracles on basal angle (Figs 4, 7, 11, A–B, laVIII). Exposed portion of gonocoxites IX rectangular, wider than long, slightly covering proximal lateral margins of laterotergites IX (Figs 4, 7, 11, A–B, gcIX). Exposed portion of laterotergites IX digitiform, setose on apex, not attaining band uniting laterotergites VIII, separated from each other by gonocoxites IX and segment X (Figs 4, 7, 11, A–B, laIX). Segment X trapezoidal (Figs 4, 7, 11, A–B, X). Inner portion of gonocoxites IX projected in 1+1 straight elongated arms, variable in extension, and with apices rounded or acute (Figs 4, 7, 11, C–D, gcIX). Gonapophyses IX with 1+1 variable secondary thickenings (Figs 4, 7, 11, C–D, gpIX). Ring sclerites absent. Thickening of vaginal intima elongated (Figs 4, 7, 11, C–D, vi). Pars intermedialis small (Figs 4, 7, 11, C–D, pi), narrower than median duct of vesicular area. Capsula seminalis oval, longer and wider than pars intermedialis (Figs 4, 7, 11, C–D, cs).

Distribution

Throughout Africa and adjacent islands (Fig. 1).

Remarks

Afrius was created as a subgenus of *Cimex* Linnaeus, 1758 by Stål (1870), but not within the present understanding of *Cimex*, since *Cimex* currently corresponds to a genus of Cimicidae. At the time of the description, three species of *Afrius* were recognized, viz. *Cimex (Afrius) figuratus* (Germar, 1838), *C. (Afrius) purpureus* (Westwood, 1837) and *C. (Afrius) flavirostris* Stål, 1864, while two others (*Canthecona marmorata* Dallas, 1851 and *C. annulipes* Dallas, 1851) were mentioned as species *incertae sedis*. Lethierry & Severin (1893) included all the above five species in *Afrius*. Schouteden (1907a) divided the genus into two subgenera (*Afrius* s. str. and *Subafrius* Schouteden, 1907a), separating them by the size of the scutellum and by the presence of abdominal silvery patches in the male of the subgenus *Afrius*.

Afrius can be differentiated from most African genera of Asopinae by the following combined characteristics: lateral pronotal margins crenulated on anterior half, presence of a well-developed spine on profemora, and abdominal basal tubercle short, not extending beyond metacoxae. The genus shares these features only with *Canthecona* Amyot & Serville, 1843, *Glypus* Dallas, 1851 and *Picromerus* Amyot & Serville, 1843; however, the posterior abdominal segment of *Canthecona* is acuminate, not obtuse as in *Afrius*; the abdominal tubercle is bifid in *Glypus*, not single as in *Afrius*; and the metapleural evaporatorium is more developed in *Picromerus* in comparison with *Afrius*.

We maintain the division of *Afrius* in two subgenera based on the presence or absence of abdominal glandular patches (Schouteden 1907a; Thomas 1994) and morphological differences of the male genitalia, described below. We do not consider, however, these subgenera as two distinct genera because the presence or absence of abdominal glandular patches can be interspecifically variable in other genera of Asopinae, as in *Macrorhaphis* Dallas, 1851 (Thomas 1994). Besides, the species of *Afrius* present many similarities of general morphology, of female genitalia, and of the pygophore, mainly the genital plates. Perhaps a phylogenetic study may better elucidate the classification of *Afrius* in future.

Key to the species of *Afrius* Stål, 1870

1. Scutellum wider than long, humeral pronotal angles laterally well projected to acute angle (Fig. 2B, D, F, H, J). Male abdomen without setose patches on segments V and VI (Fig. 2C, L), parameres with two evident rami (Fig. 3G–H) *A. (Subafrius) flavirostrum* (Signoret, 1861)
- Scutellum longer than wide (Figs 5B, D, 8B, D, F, H, J, L, N, P), humeral pronotal angles slightly projected to acute (Figs 5B, 9B), rounded (Fig. 9A, C) or triangular angle (Fig. 9D). Male abdomen with setose patches on segments V and VI (Fig. 8C), parameres without two evident rami, triangular (Figs 6G–H, 10G–H) 2
2. Postfrenal lobe of scutellum enlarged, constriction line (sc) broader than adjacent region (ac) of corium until radial vein (Fig. 8H). Humeral angles slightly emarginated (Fig. 9) *A. (Afrius) purpureus* (Westwood, 1837)
- Postfrenal lobe narrow, constriction line (sc) equal or shorter than adjacent region (ac) of corium until radial vein (Fig. 5D). Humeral angles not emarginated (Fig. 5B, D) *A. (Afrius) kollerii* Schouteden, 1911

Afrius (Subafrius) Schouteden, 1907

Afrius (Subafrius) Schouteden, 1907a: 51. Type species by original monotypy: *Picromerus flavirostrum* Signoret, 1861.

Afrius (Subafrius) – Kirkaldy 1909: 10. — Cachan 1952: 306. — Thomas 1994: 152. — Maldès & Pluot-Sigwalt 2004: 20. — Rider 2006: 234.

Diagnosis

Males without abdominal glandular patches; parameres divided in two lobes; dorsal disc of vesica covered by fine and inconspicuous microsculptures.

Afrius (Subafrius) flavirostrum (Signoret, 1861)

Diagnosis

Scutellum wider than long, humeral pronotal angles laterally well projected to an acute angle; male abdomen without setose patches; parameres with two distinct lobes.

Redescription

BODY. Elongated oval, yellowish to brown, usually with a pale posterior margin of the scutellum.

HEAD. Subrectangular, wider than long, uniformly punctured; mandibular plates equal or slightly shorter than and twice as wide as clypeus, anteriorly rounded, with margin straight to slightly sinuous; antennomeres yellow to brownish, black coloured on apical halves of third to fifth antennomeres, bearing thin setae, denser on third to fifth antennomeres; proportion of lengths of antennomeres: II \geq IV > V > III > I; labium robust, reaching metasternum, last segment darker than preceding; proportion of lengths of labiomeres: II > I \geq III > IV.

THORAX. Pronotum hexagonal, uniformly punctured except on cicatrices, twice or more as wide as long, cicatrices flat. Anterior margin concave. Lateral margins sinuous, slightly crenulated on anterior half, humeral angle laterally projected, emarginated, apices acute. Scutellum wider than long. Corium longer than scutellum, reaching connexival segment VI, uniformly punctured, membrane surpassing apex of abdomen (Fig. 2).

MALE ABDOMEN. Without setose patches; parameres biramous (Fig. 3F–H, par).

Male

MEASUREMENTS (n = 5). Head length 1.82 ± 0.18 (1.68–2.10); width 1.93 ± 0.15 (1.87–2.13); pronotum length 2.52 ± 0.48 (1.85–3.22); width 6.44 ± 0.64 (5.64–7.25); scutellum length 3.02 ± 0.32 (2.66–3.48); width 3.22 ± 0.34 (2.88–3.75); lengths of antennomeres: I 0.32 ± 0.05 (0.27–0.37), II 1.26 ± 0.11 (1.2–1.39), III 1.12 ± 0.23 (0.97–1.37), IV 1.32 ± 0.21 (1.12–1.54); V 1.16 ± 0.13 (1.05–1.31); lengths of labiomeres: I 0.94 ± 0.02 (0.93–0.97), II 1.13 ± 0.09 (1.05–1.23), III 0.97 ± 0.10 (0.90–1.90), IV 0.81 ± 0.02 (0.78–0.82); length of abdomen 4.50 ± 0.70 (4.00–5.00); width 4.82 ± 0.25 (4.65–5.00); total length 9.87 ± 0.71 (9.19–11.00).

GENITALIA. Genital plates elongated and cylindrical (Fig. 3A, C–D, F, I, gp). Parameres long, biramous, head V-shaped divided into one process long, acute and another shorter, rounded, dorsally directed, extended beyond pygophore (Fig. 3A–H, par). Phallus. Thecal shield about twice as long as basal theca, widely opened posteriorly (Fig. 3J–Q, ts). Vesica subrectangular in dorsal view (Fig. 3O–Q, v), golf club-shaped in lateral view, with apex subtriangular and a central, slightly elevated, rounded portion covered by fine and inconspicuous microsculptures (Fig. 3L–N, v, m); ductus seminis enlarged near

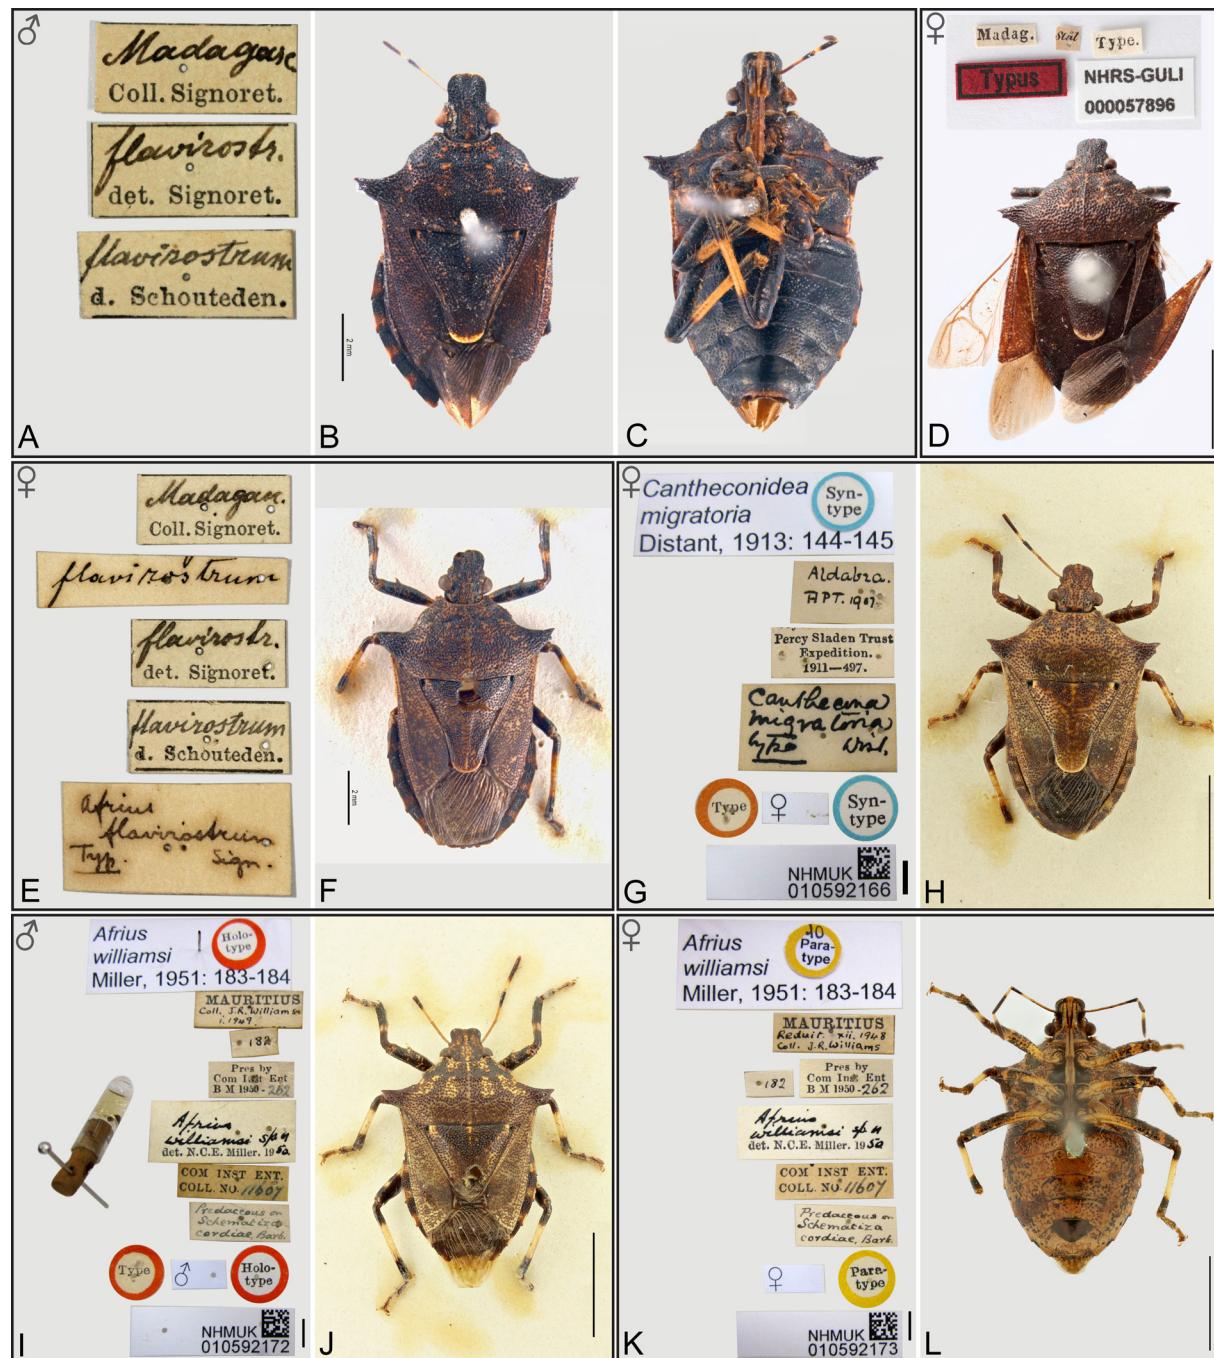

Fig. 2. *Afrius (Subafrius) flavirostrum* (Signoret, 1861), type specimens. **A–C.** *Picromerus flavirostrum* Signoret, 1861, syntype ♂, labels, dorsal and ventral habitus, respectively (images courtesy of Herbert Zettel and Harald Bruckner, NHMW). **D.** *Picromerus flavirostrum*, syntype ♀, labels and dorsal habitus (image courtesy of Gunvi Lindberg, NHRS). **E–F.** *Picromerus flavirostrum*, syntype ♀, labels and dorsal habitus (images courtesy of Herbert Zettel and Harald Bruckner, NHMW). **G–H.** *Cantheconidea migratoria* Distant, 1913, syntype ♀, labels and dorsal habitus (NHMUK). **I–J.** *Afrius williamsi* Miller, 1951, holotype ♂, labels and dorsal habitus (NHMUK). **K–L.** *Afrius williamsi*, paratype ♀, labels and ventral habitus (NHMUK). Fig. 3. *Afrius (Subafrius) flavirostrum* (Signoret, 1861), male genitalia. **A–F.** Pygophore in dorsal (A, D), ventral (B, E) and posterior (C, F) views. **G–H.** Right paramere in lateral views, internal and external respectively. **I.** Right genital plate, dorso-posterior view. **J–L.** Phallus in anterior, posterior and lateral views, respectively. **M.** Detail of the vesica in lateral view, also represented in N. **N.** Drawing of the phallus. **O–Q.** Phallus in dorsal view. Abbreviations: bf = basal foramen; bp = basal plates; bt = basal theca; cl = conjunctival lobes; db = dorsal border; ds = ductus seminis; er = ejaculatory reservoir; gp = genital plates; il = inferior layer; m = microsculptures; pa = posterolateral angles; par = parameres; ph = phallotheca; sg = secondary gonophore; sp = conjunctival process; ts = thecal shield; v = vesica; vb = ventral border; X = segment X. Scale bars: F = 0.5 mm; G–Q = 0.25 mm.

apex (Fig. 3K–Q, ds). Apices of conjunctival lobes globose, endowed with a set of sculptured processes, forming a subrectangular projection in lateral view (Fig. 3K–P, cl, sp).

Female

MEASUREMENTS ($n = 5$). Head length 1.87 ± 0.10 (1.80–1.95); width 1.78 ± 0.18 (1.65–1.91); pronotum length 2.62 ± 0.17 (2.5–2.74); width 3.48 ± 0.07 (3.43–3.53); scutellum length 3.01 ± 0.07 (2.96–3.07); width 3.24 ± 0.18 (3.11–3.37); length of antennomeres: I 0.30 ± 0.0 (0.30–0.30), II 1.29 ± 0.03 (1.27–1.31), III 1.08 ± 0.0 (1.08–1.08), IV 1.28 ± 0.05 (1.24–1.31); V 1.16 ± 0.06 (1.12–1.20); length of labiomeres: I 0.97 ± 0.06 (0.93–1.01), II 1.14 ± 0.03 (1.12–1.16), III 0.94 ± 0.0 (0.94–0.94), IV $0.86 \pm$

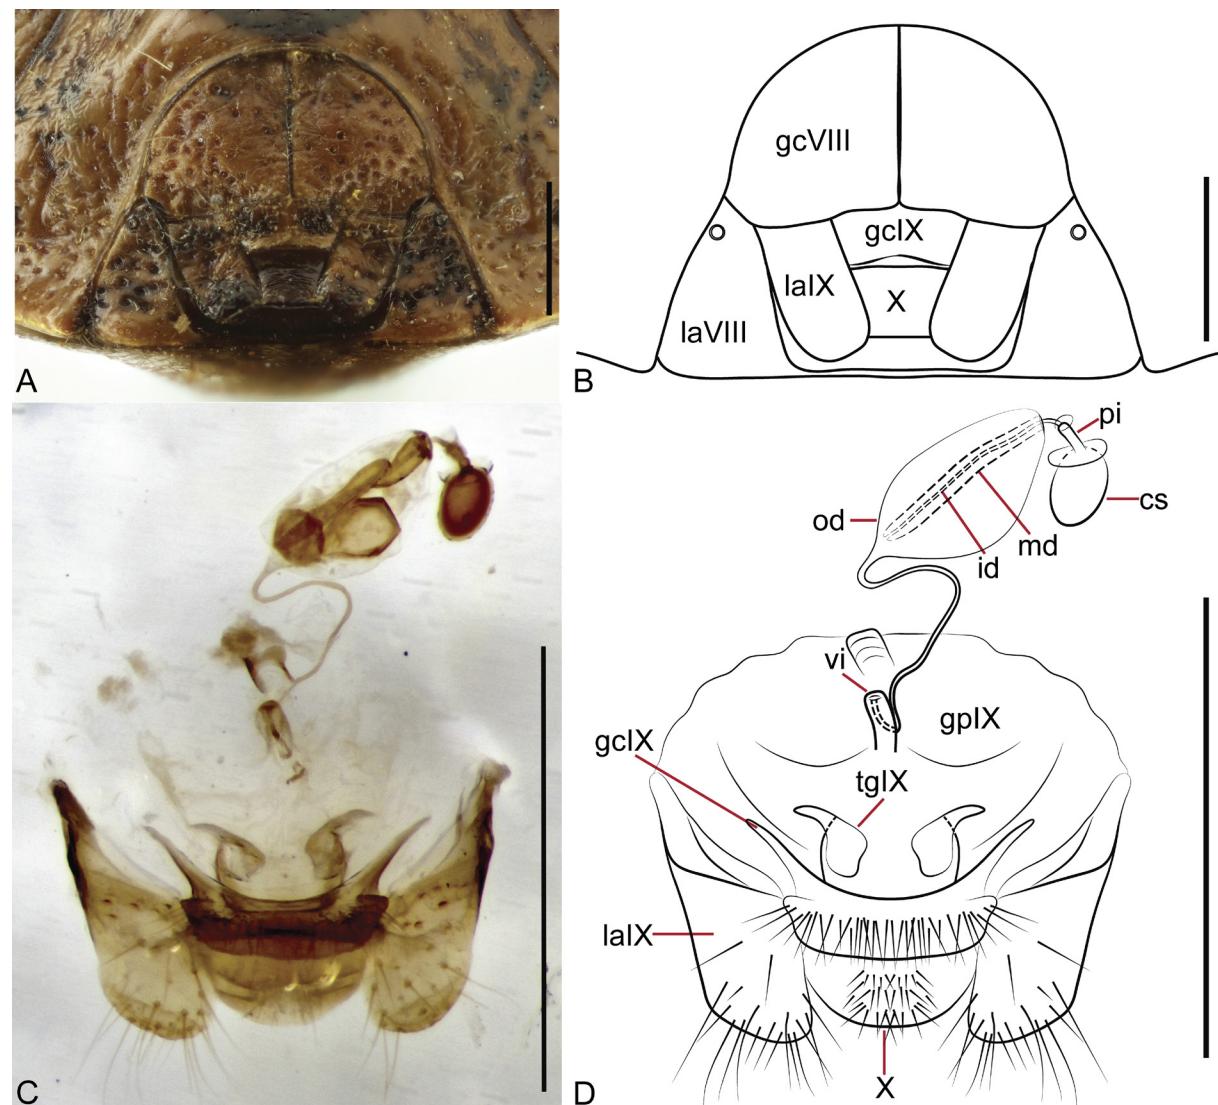

Fig. 4. *Afrius (Subafrius) flavirostrum* (Signoret, 1861), female genitalia. **A–B.** Genital plates, ventroposterior view. **C–D.** Inner genitalia, ventral view. Abbreviations: cs = capsula seminalis; gcVIII = gonocoxites VIII; gcIX = gonocoxites IX; gpIX = gonapophyses IX; id = inner duct; laVIII = laterotergites VIII; laIX = laterotergites IX; md = median duct of vesicular area; od = outer duct of vesicular area; pi = pars intermedialis; tgIX = secondary thickening of gonapophyses IX; vi = thickening of vaginal intima; X = segment X. Scale bars: A–B = 1 mm; C–D = 0.5 mm.

0.06 (0.82–0.90); length of abdomen 5.12 ± 0.05 (5.08–5.16); width 5.24 ± 0.0 (5.24–5.24); total length 9.51 ± 1.14 (8.70–10.32).

GENITALIA. Gonocoxites VIII slightly longer than wide, mesial portions of posterior margins slightly constricted (Fig. 4A–B, gcVIII). Median and inner ducts of vesicular area with uniform diameter (Fig. 4C–D, md, id).

Distribution

Madagascar (Signoret 1861), Seychelles Islands (Distant 1913), Mauritius (Miller 1952) (Table 1, Fig. 1).

Remarks

Although this species seems similar to *A. (Afrius) purpureus* (Westwood, 1837) in general aspect, this is the most distinct species of the genus: the scutellum is wider than long, the males do not have abdominal glandular patches, the parameres are divided into two arms, and the vesica is shorter and less microsculptured in comparison to that of *A. (Afrius) purpureus* and *A. (Afrius) kolleri* Schouteden, 1911. Because of the aforementioned, we have kept the subgeneric classification, grouping *A. kolleri* and *A. purpureus* in the subgenus *Afrius*, and *A. flavirostrum* in the subgenus *Subafrius*.

When describing *A. williamsi*, Miller (1952) compared his new species with *A. marmoratus* (Dallas, 1851), but did not mention *A. (Subafrius) flavirostrum*.

The two new synonymies proposed herein were previously pointed out by Orian in his unpublished thesis (Orian 1965).

Afrius (Afrius) Stål, 1870

Cimex (Afrius) Stål, 1870: 44.

Afrius (Afrius) — Schouteden 1907a: 51–52. — Kirkaldy 1909: 10. — Thomas 1994: 151–152. — Maldès & Pluot-Sigwalt 2004: 20.

Diagnosis

Males with abdominal glandular patches; parameres not divided in two lobes; dorsal disc of vesica covered by dense and demarcated microsculptures.

Afrius (Afrius) kolleri Schouteden, 1911

Figs 1, 5–7

Afrius kolleri Schouteden, 1911: 180; lectotype herein designated.

Afrius kolleri — Schouteden 1963: 399; 1972: 106. — Gillon 1972: 352; 1974: 219. — Thomas 1994: 151. — Maldès & Pluot-Sigwalt 2004: 20. — Robertson 2009: 22–23.

Types examined

DEMOCRATIC REPUBLIC OF THE CONGO • *Afrius kolleri* Schouteden, 1911; lectotype ♂ (here designated); labels: “Holotypus”, “MUSÉE DU CONGO Galli-Koko Kasai R. CARLIER”, “*Afrius* Stål *kolleri* Schout.”, “*Afrius kolleri* n. sp.”; Fig. 5A–B; RMCA • Paralectotype ♀; labels: “Paratypus”, “MUSÉE DU CONGO LUKOMBE. 6.X.08 A. Koller”; Fig. 5C–D; RMCA.

Diagnosis

Scutellum longer than wide, postfrenal lobe narrow; humeral pronotal angles not emarginated; male abdomen with setose patches on segments V and VI, parameres triangular, without two distinct lobes.

Redescription

BODY. Pentagonal elongated, reddish to brown, usually with black stripes on head, pronotum, scutellum, and corium.

HEAD. Quadrate, as long as wide or slightly wider than long, uniformly punctured; mandibular plates equal or slightly longer than clypeus, and slightly wider than clypeus, with margins straight to slightly sinuous; clypeus black; ocelli surrounded by subquadrate black spots; antennomeres usually black, proportion of lengths of antennomeres: V > IV > III = II > I; labium robust, reaching metasternum; proportion of lengths of labiomeres: II > I > III > IV.

THORAX. Pronotum hexagonal, uniformly punctured, wider than long, with 1+1 black transversal stripes on cicatrices, 1+1 black vertical spots on humeral angles and 3 longitudinal stripes on disc; cicatrices flat, black, sometimes with a central red spot, demarcated by punctures; anterior margin concave; lateral margins sinuous, crenulated on anterior half; humeri triangular, not emarginated. Scutellum longer than wide, uniformly punctured, reaching an imaginary line connecting middle of connexival segments V, partially or entirely emarginated in black and with one triangular black central spot along frenal lobe; postfrenal lobe narrow, narrower than corium at same region. Corium longer than scutellum, reaching connexival segment VI. Protibiae slightly expanded (Fig. 5).

MALE ABDOMEN. With setose patches on segments V and VI; parameres uniramous, triangular.

Male

MEASUREMENTS (n = 3). Head length 1.95 ± 0.20 (1.72–2.07); width 2.07 ± 0.06 (2.02–2.15); pronotum length 2.76 ± 0.23 (2.52–2.98); width 4.86 ± 0.40 (4.53–5.32); scutellum length 3.23 ± 0.13 (3.08–3.33); width 2.90 ± 0.09 (2.80–2.96); length of antennomeres: I 0.31 ± 0.05 (0.27–0.37), II 1.05 ± 0.07 (0.97–1.12), III 1.08 ± 0.04 (1.05–1.12), IV 1.34 ± 0.06 (1.30–1.38); V 1.50 ± 0.00 (1.50–1.50); length of labiomeres: I 0.86 ± 0.03 (0.84–0.90), II 1.16 ± 0.03 (1.12–1.18), III 0.92 ± 0.02 (0.90–0.93), IV

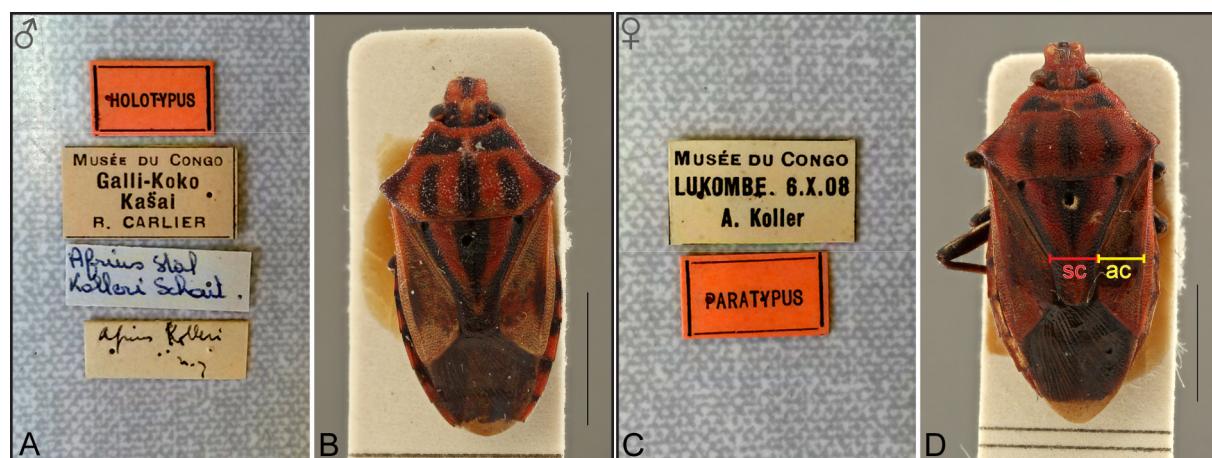

Fig. 5. *Afrius (Afrius) kollerii* Schouteden, 1911, types. **A–B.** Lectotype ♂, labels and dorsal habitus (RMCA). **C–D.** Paratype ♀, labels and dorsal habitus (RMCA). Abbreviations: ac = corium adjacent to the scutellum constriction; sc = scutellum constriction. Scale bars: 4 mm.

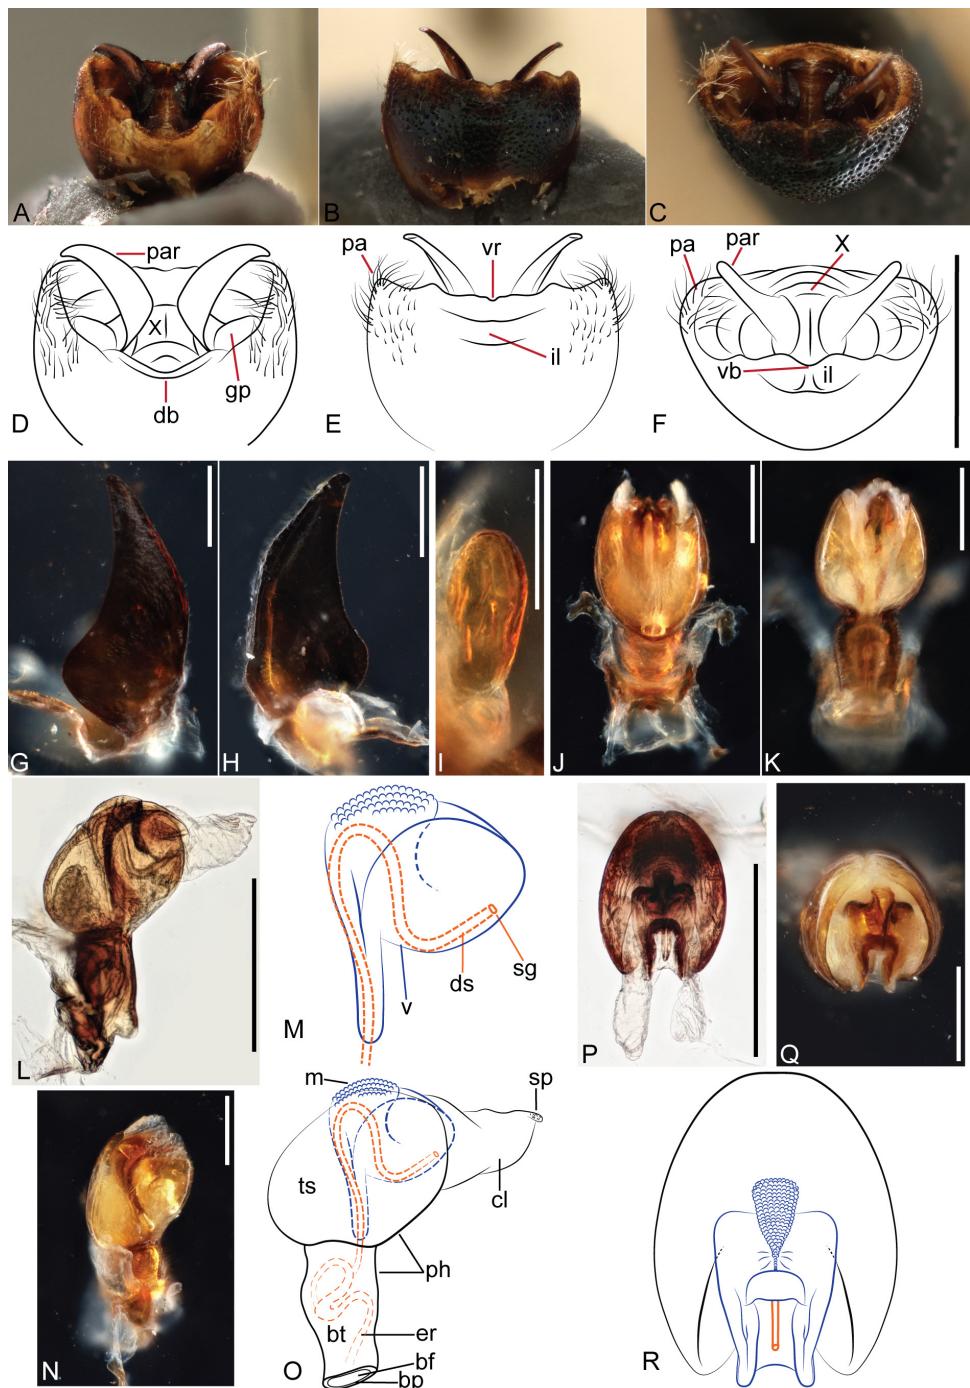

Fig. 6. *Afrius (Afrius) kollerii* Schouteden, 1911, male genitalia. A–F. Pygophore in dorsal (A, D), ventral (B, E) and posterior (C, F) views. G–H. Right paramere in lateral views, internal and external respectively. I. Right genital plate, dorso-posterior view. J–L. Phallus in anterior, posterior and lateral views, respectively. M. Detail of the vesica in lateral view, also represented in O. N. Phallus in dorso-lateral view. O. Drawing of the phallus. P–R. Phallus in dorsal view. Abbreviations: bf = basal foramen; bp = basal plates; bt = basal theca; cl = conjunctival lobes; db = dorsal border; ds = ductus seminis; er = ejaculatory reservoir; gp = genital plates; il = inferior layer; m = microsculptures; pa = posterolateral angles; par = parameres; ph = phallotheca; sg = secondary gonophore; sp = conjunctival process; ts = thecal shield; v = vesica; vb = ventral border; X = segment X. Scale bars: D–F, L, P = 0.5 mm; G–K, N, Q = 0.25 mm.

0.92 ± 0.02 (0.90–0.93); length of abdomen 5.12 ± 0.17 (5.00–5.24); width 4.56 ± 0.15 (4.45–4.67); total length 10.11 ± 1.00 (9.00–10.97).

GENITALIA. Genital plates cylindrical (Fig. 6A, D, I, gp). Parameres long, uniramous, head triangularly elongated, dorsally directed, extended beyond pygophore (Fig. 6A–H, par). Phallus. Thecal shield and basal theca subequal in length (Fig. 6L, N–O, ts, bt). Vesica shield-shaped in dorsal view (Fig. 6P–R), golf club-shaped in lateral view (Fig. 6L–O, v), with apex rounded and a central elevated microsculptured

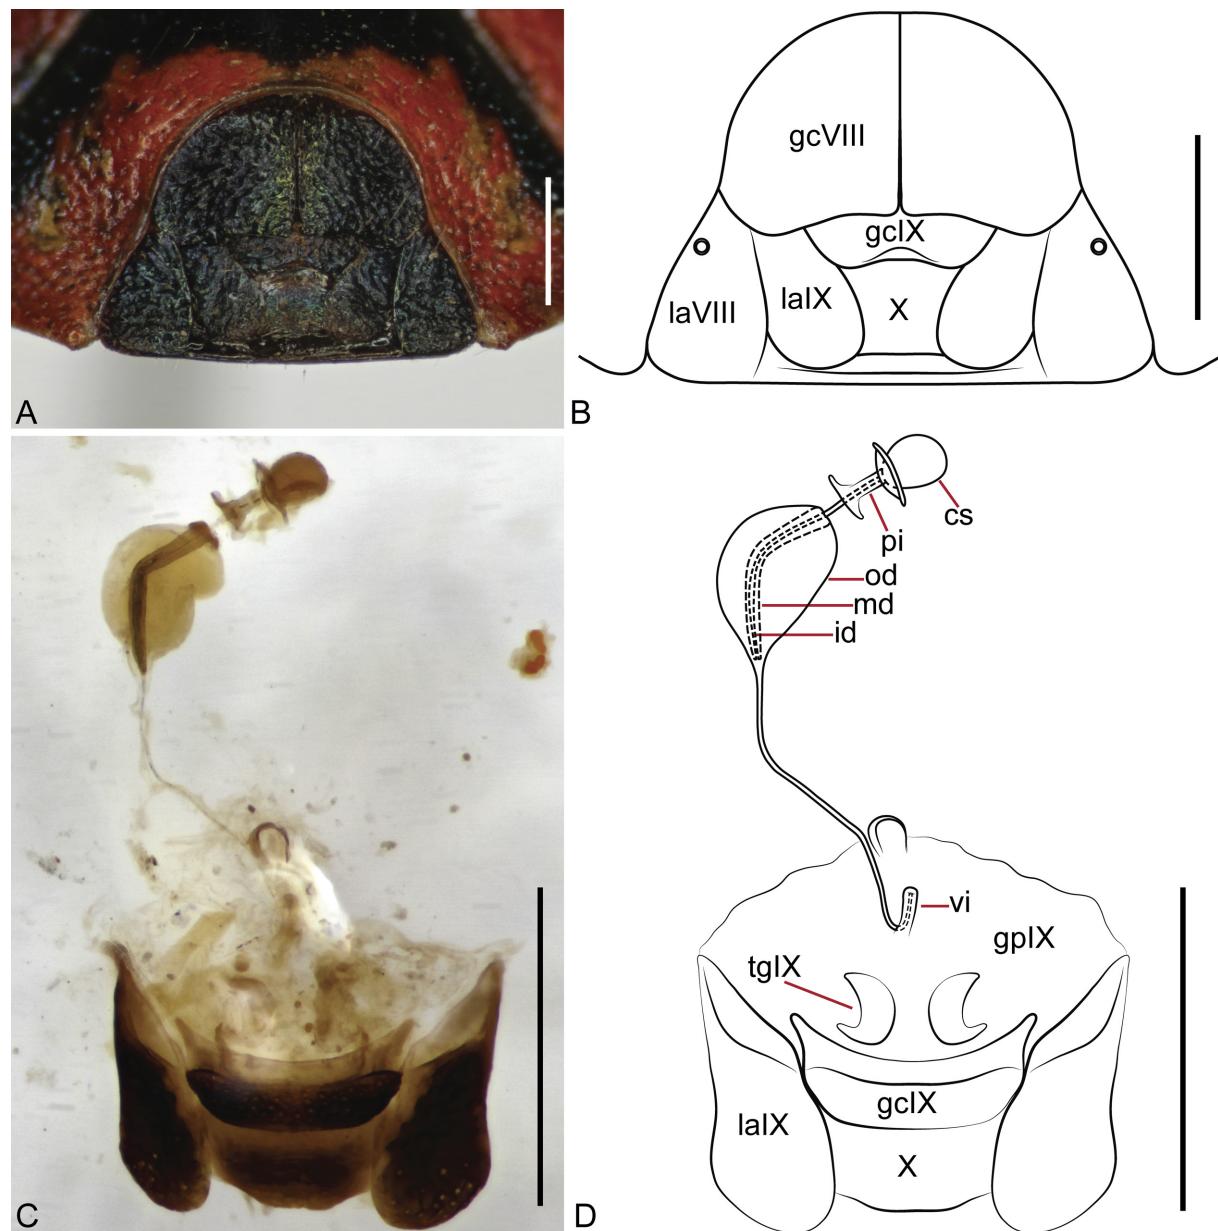

Fig. 7. *Afrius (Afrius) kollerii* Schouteden, 1911, female genitalia. A–B. Genital plates, ventroposterior view. C–D. Inner genitalia, ventral view. Abbreviations: cs = capsula seminalis; gcVIII = gonocoxites VIII; gcIX = gonocoxites IX; gpIX = gonapophyses IX; laVIII = laterotergites VIII; id = inner duct; laIX = laterotergites IX; md = median duct of vesicular area; od = outer duct of vesicular area; pi = pars intermedialis; tgIX = secondary thickening of gonapophyses IX; vi = thickening of vaginal intima; X = segment X. Scale bars: A–B = 1 mm; C–D = 0.5 mm.

portion (Fig. 6L–O, m), this central portion rounded in lateral view, subtriangular in dorsal view; ductus seminis with uniform diameter (Fig. 6L–R, ds). Apices of conjunctival lobes with inconspicuous sculptured process (Fig. 6L, O–P, sp).

Female

MEASUREMENTS (n = 5). Head length 2.20 ± 0.09 (2.06–2.30); width 2.20 ± 0.12 (2.05–2.35); pronotum length 3.33 ± 0.24 (3.06–3.63); width 5.81 ± 0.31 (5.56–6.03); scutellum length 3.94 ± 0.27 (3.71–4.30); width 3.34 ± 0.26 (3.07–3.75); length of antennomeres: I 0.35 ± 0.01 (0.33–0.37), II 1.18 ± 0.07 (1.12–1.25), III 1.18 ± 0.08 (1.12–1.27), IV 1.47 ± 0.13 (1.31–1.62); V 1.42 ± 0.0 (1.42–1.42); length of labiomeres: I 1.04 ± 0.13 (0.90–1.23), II 1.27 ± 0.07 (1.20–1.35), III 1.00 ± 0.08 (0.93–1.12), IV 0.98 ± 0.10 (0.83–1.08); length of abdomen 6.40 ± 0.45 (6.03–7.09); width 5.59 ± 0.34 (5.40–6.20); total length 11.98 ± 0.86 (11.12–13.22).

GENITALIA. Gonocoxites VIII slightly longer than wide, posterior margins sinuous (Fig. 7 A–B, gcVIII). Median and inner ducts of vesicular area slightly widening to apex (Fig. 7 C–D, md, id).

Distribution

Democratic Republic of the Congo (Schouteden 1911), Ivory Coast (Gillon 1972), Ethiopia, Uganda (Thomas 1994), Cameroon (Maldès & Pluot-Sigwalt 2004) (Table 1, Fig. 1).

Remarks

This species is apparently most similar to *A. (Afrius) purpureus* because they both present glandular patches on the abdominal venter of males, parameres that are not divided in two rami and vesica microsculptures.

The description of *Afrius kollerii* was based on an unspecified number of specimens of both sexes (Schouteden 1911). We examined two specimens at RMCA: a male labelled as holotype and a female labelled as paratype. Since no holotype was designated in the original description, both of them must be considered as syntypes; accordingly, we hereby designate the male specimen as lectotype.

Afrius (Afrius) purpureus (Westwood, 1837)

Figs 1, 8–11

Pentatoma yolofo Guérin-Méneville, 1831: 55, fig. 2 and legend (syn. Stål 1870: 44).

Pentatoma purpurea Westwood, 1837: 43.

Asopus figuratus Germar, 1838: 185–186 (syn. Schouteden 1905: 147, as a var. of *Canthecona purpurea*).

Canthecona caerulea Dallas, 1851: 89 (syn. Stål 1862: 496, as var. of *Canthecona Yolofa* Guérin; syn. Stål 1870: 44).

Canthecona marginella Dallas, 1851: 89 (syn. Stål 1862: 496, as var. of *Canthecona Yolofa* Guérin; syn. Stål 1870: 44).

Canthecona marmorata Dallas, 1851: 90 (synonymy with *Canthecona purpurea* suspected by Schouteden 1905a: 150). **syn. nov.**

Canthecona annulipes Dallas, 1851: 90–91 (syn. Schouteden 1905a: 149–150, with *Canthecona marmorata*; synonymy with *Canthecona purpurea* suspected by Schouteden 1905a: 150). **syn. nov.**

Canthecona miniatescens Stål, 1854: 213 (syn. Stål 1864: 66–67, with *Canthecona figurata*, as var. b.; syn. Kirkaldy 1909: 10, with *Afrius purpureus*, as a var.).

Afrius rubromarginatus Bergroth, 1903: 289. **syn. nov.**

Types examined

AFRICA • *Pentatoma purpurea* Westwood, 1837; syntype ♀; labels: “Type Hem: 242 PENTATOMA PURPUREA WESTWOOD HOPE DEPT. OXFORD”, “TYPE = WEST. (HOPE) C. Hemipt. 1837 Part. I. page 43 Distant, P.Z.S., 1900, p. 807–825.”, “Africa”, “*Afrius purpureus* Westw.”; Fig. 8E–F; OUMNH.

“EAST AFRICA” • *Afrius rubromarginatus* Bergroth, 1903; syntype ♀; labels: “Type Hem: 704 AFRIUS RUBROMARGINATUS BERGROTH. HOPE DEPT. OXFORD”, “*Afrius rubro=marginatus* Bergr.”, “Probably TANGANYIKA”, “Ann. Soc. Ent. Belg. 47: 289”, “Afriq Or”, “3/”, “TYPE”; Fig. 8O–P; OUMNH.

SIERRA LEONE • *Canthecona marginella* Dallas, 1851; syntype ♂; labels: blue-margined syntype disc label, red-margined type disc label, “87a”, “*Canthecona marginella* identified by Dallas”, “a”, “NHMUK 010592170”; Fig. 8I–J; NHMUK 010592170.

SOUTH AFRICA • *Asopus figuratus* Germar, 1838; syntype ♀; labels: “*figuratus* Germ. Promont. b. sp. Collect. Germ.”, “*Afrius figuratus* (Germ)”, “7968”, “Typus”; Fig. 8G–H; MFNB.

SOUTH AFRICA • *Canthecona caerulea* Dallas, 1851; syntype ♂; labels: blue-margined syntype disc label, red-margined type disc label, “40 6 26 329”, “*Canthecona caerulea* identified by Dallas”, “a”, “NHMUK 010592171”; Fig. 8A–C; NHMUK 010592171.

SOUTH AFRICA • *Canthecona marmorata* Dallas, 1851; syntype ♂; labels: blue-margined syntype disc label, red-margined type disc label, “Int. S. Africa / 4319”, “3. *Canthecona marmorata*”, “a”, “NHMUK 010592164”; Fig. 8K–L; NHMUK 010592164.

SOUTH AFRICA • *Canthecona annulipes* Dallas, 1851; syntype ♀; labels: blue-margined syntype disc label, “Int. Africa / 4319”, “*Canthecona figurata* Walker’s catal.”, “a”, “NHMUK 010747805”; Fig. 8M–N; NHMUK 010747805.

SOUTH AFRICA • *Canthecona miniatescens* Stål, 1854; syntype ♀; labels: “Caffraria”, “I. Vahlb”, “*miniatescens* Stål type.”, “Typus”, “NHRS-GULI 000027293”; Fig. 8D; examined by photo; NHRS-GULI 000027293.

Diagnosis

Scutellum longer than wide, postfrenal lobe enlarged; humeral pronotal angles slightly emarginated; male abdomen with setose patches on segments V and VI, parameres triangular, without two distinct lobes.

Redescription

BODY. Elongate oval, with variable colour patterns from yellowish and brownish with yellow or red stripes (Fig. 8D, H, L, N) to purple, green and blue metallic uniform colours (Fig. 8B–C, F, J, P).

HEAD. Subrectangular, wider than long, punctured; mandibular plates equal or slightly longer than clypeus, with margin varying from straight to sinuous; antenna bearing thin setae, denser on third, fourth and fifth antennomeres, proportion of lengths of antennomeres: IV > V > II > III > I; labium robust, reaching metasternum; proportion of lengths of labiomeres: II > I > IV > III.

Fig. 8. *Afrius (Afrius) purpureus* (Westwood, 1837), type specimens. **A–C.** *Canthecona caerulea* Dallas, 1851, syntype ♂, labels, dorsal and ventral habitus, respectively (NHMUK). **D.** *Canthecona miniatescens* Stål, 1854, syntype ♀, labels and dorsal view (image courtesy of Gunvi Lindberg, NHRG). **E–F.** *Pentatoma purpurea* Westwood, 1837, syntype ♀, labels and dorsal habitus (OUMNH). **G–H.** *Asopus figuratus* Germar, 1838, syntype ♀, labels and dorsal habitus (MFNB). **I–J.** *Canthecona marginella* Dallas, 1851, syntype ♂, labels and dorsal habitus (NHMUK). **K–L.** *Canthecona marmorata* Dallas, 1851, syntype ♂, labels and dorsal habitus (NHMUK). **M–N.** *Canthecona annulipes* Dallas, 1851, syntype ♀, labels and dorsal habitus (NHMUK). **O–P.** *Afrius rubromarginatus* Bergroth, 1903, syntype ♀, labels and dorsal habitus (OUMNH). Abbreviations: ac = corium adjacent to the scutellum constriction; sc = scutellum constriction. Scale bars: 4 mm.

THORAX. Pronotum hexagonal, densely punctured, twice or more as wide as long, cicatrices flat; anterior margin concave; lateral margins strongly sinuous, crenulated on anterior half (Fig. 9), humeral angle slightly emarginated, anterior humeral portion varying from convex (Fig. 9A, C) to acute or spinose (Fig. 9B, D). Scutellum longer than wide, densely punctured. Corium longer than scutellum, usually not surpassing connexival segment V, densely punctured.

MALE ABDOMEN. Setose patches present on male abdominal segments V and VI (Fig. 8C); parameres uniramous, triangular.

Male

MEASUREMENTS ($n = 5$). Head length 1.69 ± 0.08 (1.61–1.76); width 1.90 ± 0.12 (1.76–2.10); pronotum length 2.83 ± 0.30 (2.41–3.22); width 5.70 ± 0.46 (5.32–6.45); scutellum length 3.51 ± 0.29 (3.14–3.95); width 3.33 ± 0.28 (3.06–3.79); length of antennomeres: I 0.30 ± 0.04 (0.26–0.34), II 1.08 ± 0.11 (0.93–1.24), III 1.06 ± 0.10 (0.93–1.16), IV 1.26 ± 0.11 (1.12–1.39), V 1.22 ± 0.09 (1.12–1.31); length of labiomeres: I 0.93 ± 0.12 (0.79–1.12), II 1.06 ± 0.09 (0.94–1.09), III 0.80 ± 0.09 (0.67–0.94), IV 0.83 ± 0.08 (0.71–0.94); length of abdomen 4.67 ± 0.46 (4.03–5.24); width 4.83 ± 0.40 (4.43–5.48); total length 10.03 ± 0.52 (9.35–10.64).

GENITALIA. Genital plates cylindrical (Fig. 10A, C–D, F, I, gp). Parameres long, uniramous, head elongated triangular, dorsally directed, extended beyond pygophore (Fig. 10A–H, par). Phallus. Basal theca and thecal shield subequal in length (Fig. 10L–R, bt, ts). Vesica subtriangular in dorsal view (Fig. 10P–R, v), golf club-shaped in lateral view, with apex obtuse and a central, strongly elevated portion covered by microsculptures (Fig. 10L–O, v, m), this central portion broad, rectangular in lateral view, cylindrical in dorsal view; ductus seminis uniform (Fig. 10L–R, ds), dorsally directed. Apices of conjunctival lobes globose, endowed with a set of small sculptured processes (Fig. 10L, N, O, cl, sp).

Female

MEASUREMENTS ($n = 5$). Head length 2.12 ± 0.19 (1.83–2.28); width 2.12 ± 0.12 (1.91–2.21); pronotum length 3.17 ± 0.20 (2.82–3.30); width 6.94 ± 0.31 (6.45–7.25); scutellum length 4.43 ± 0.39 (3.79–4.75); width 4.06 ± 0.34 (3.46–4.35); lengths of antennomeres: I 0.38 ± 0.04 (0.34–0.45), II 1.30 ± 0.15 (1.12–1.42), III 1.17 ± 0.14 (0.93–1.31), IV 1.50 ± 0.19 (1.16–1.61), V 1.37 ± 0.15 (1.12–1.50); lengths of labiomeres: I 1.04 ± 0.07 (0.94–1.12), II 1.27 ± 0.15 (1.01–1.38), III 0.93 ± 0.09 (0.78–1.01), IV 0.94 ± 0.11 (0.75–1.05); length of abdomen 6.17 ± 0.34 (5.64–6.45); width 6.27 ± 0.42 (5.64–6.61); total length 11.96 ± 0.83 (10.80–13.06).

GENITALIA. Gonocoxites VIII slightly wider than long, posterior margins sinuous (Fig. 11A–B, gcVIII). Median and inner duct of vesicular area of uniform diameter (Fig. 11C–D, md, id).

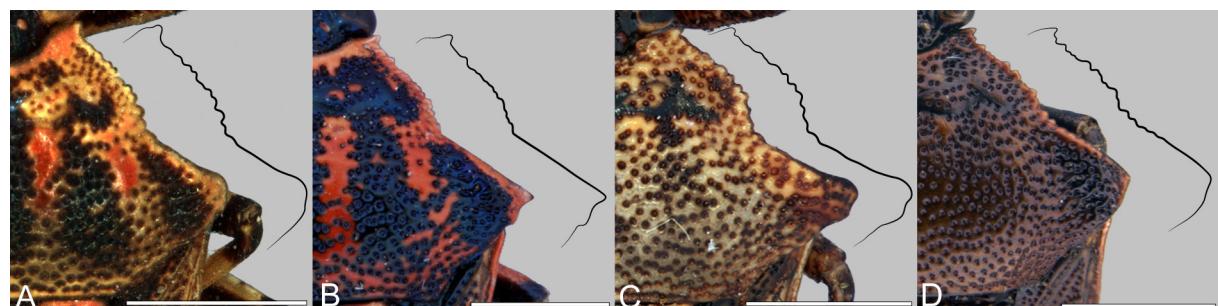

Fig. 9. *Afrius (Afrius) purpureus* (Westwood, 1837), variation of the pronotum shape. Scale bars: 2 mm.

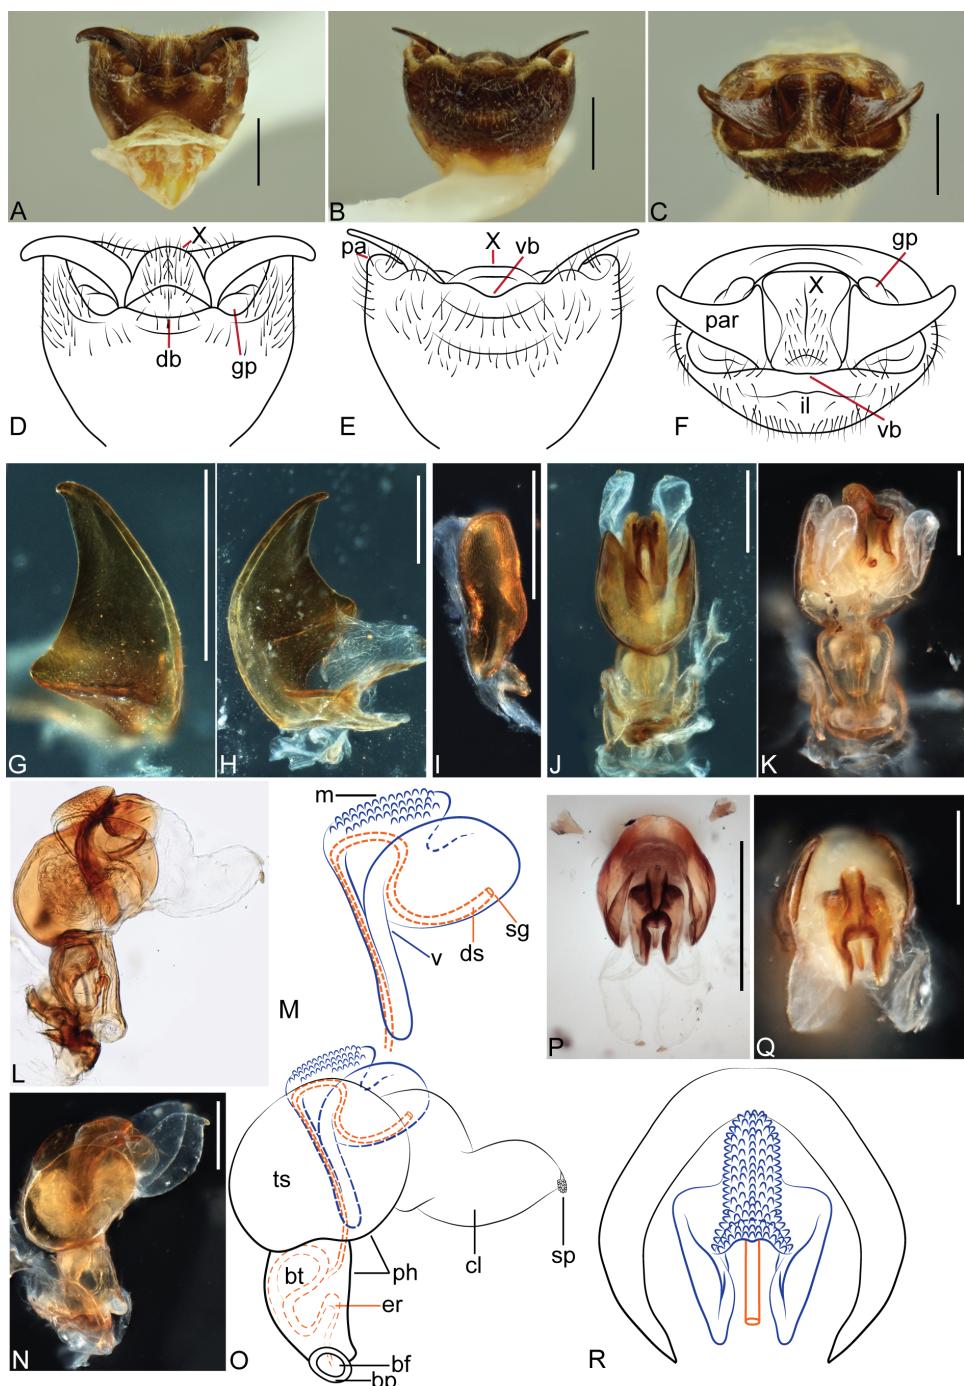

Fig. 10. *Afrius (Afrius) purpureus* (Westwood, 1837), male genitalia. A–F. Pygophore in dorsal (A, D), ventral (B, E) and posterior (C, F) views. G–H. Right paramere in lateral views, internal and external respectively. I. Right genital plate, dorso-posterior view. J–L. Phallus in anterior, posterior and lateral views, respectively. M. Detail of the vesica in lateral view, also represented in O. N. Phallus in lateral view. O. Drawing of the phallus. P–R. Phallus in dorsal view. Abbreviations: bf = basal foramen; bp = basal plates; bt = basal theca; cl = conjunctival lobes; db = dorsal border; ds = ductus seminis; er = ejaculatory reservoir; gp = genital plates; il = inferior layer; m = microsculptures; pa = posterolateral angles; par = parameres; ph = phallotheca; sg = secondary gonophore; sp = conjunctival process; ts = thecal shield; v = vesica; vb = ventral border; X = segment X. Scale bars: A–C = 0.5 mm; G–K, N, P–Q = 0.25 mm.

Distribution

South Africa (Germar 1838), Senegal (Guérin-Méneville 1844), Sierra Leone (Dallas 1851), Guinea (Stål 1864), Equatorial Guinea [as Fernando Po] (Stål 1870), Ghana (Reuter 1882), Mozambique (Gerstaecker 1892), Zimbabwe [as Mashonaland] (Distant 1898), Democratic Republic of the Congo (Distant 1901), Equatorial Guinea [as Fernando Po] (Stål 1870), Ghana (Reuter 1882), Mozambique (Gerstaecker 1892), Benin, Cameroon, Central African Republic [as Haute-Sangha], Eritrea, Ethiopia

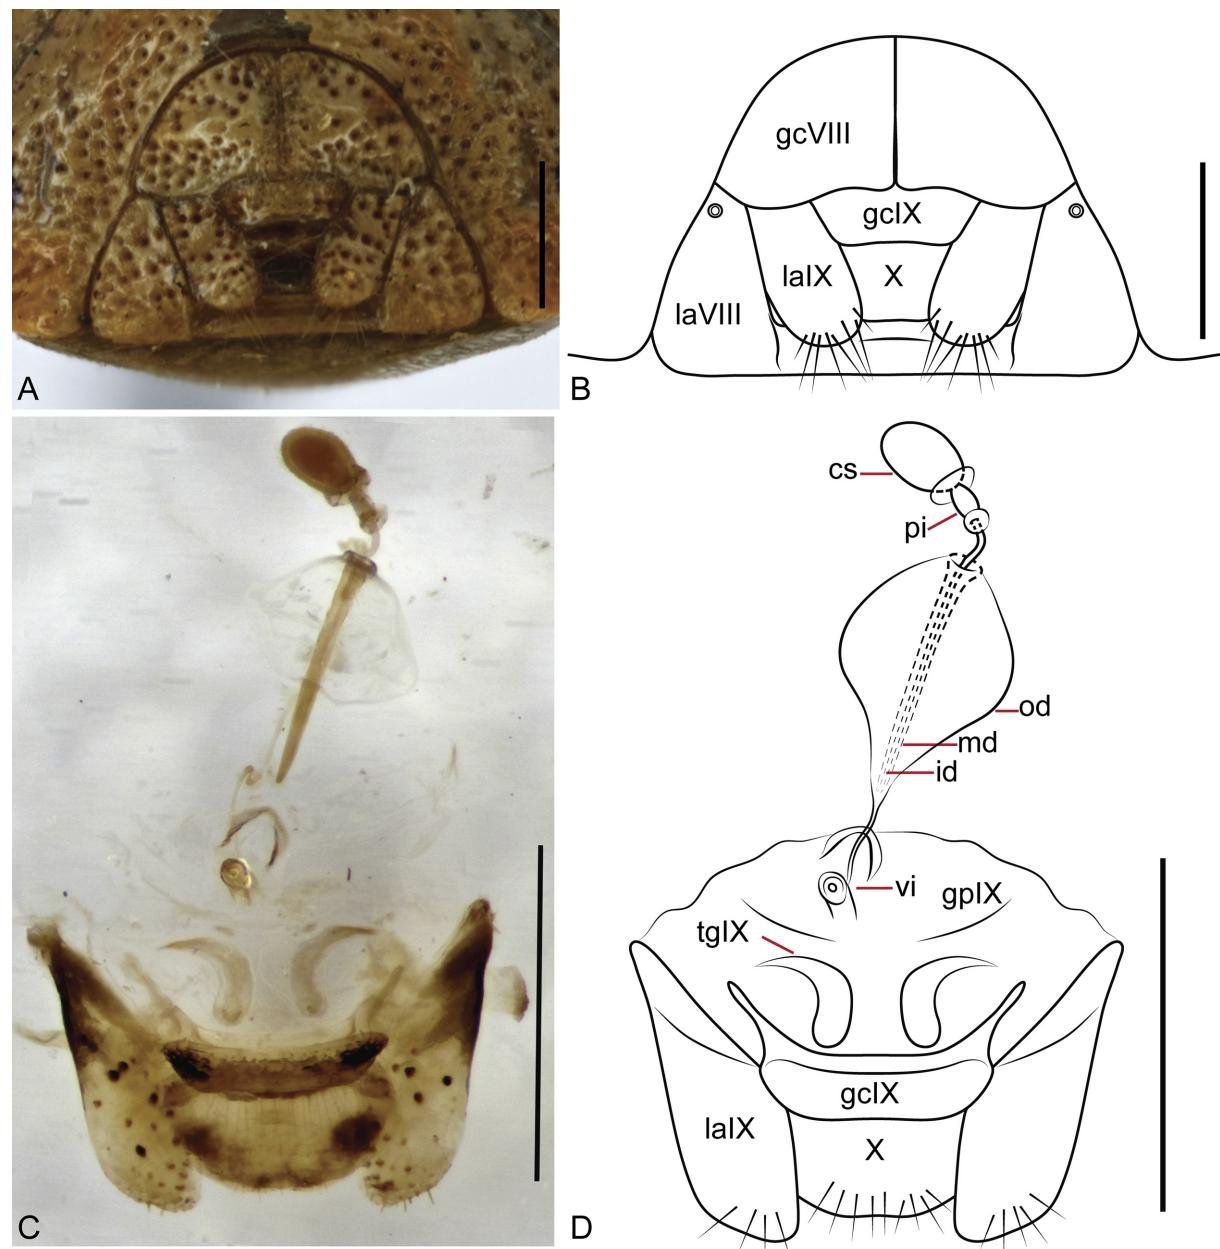

Fig. 11. *Afrius (Afrius) purpureus* (Westwood, 1837), female genitalia. **A–B.** Genital plates, ventroposterior view. **C–D.** Inner genitalia, ventral view. Abbreviations: cs = capsula seminalis; gcVIII = gonocoxites VIII; gclIX = gonocoxites IX; gplIX = gonapophyses IX; id = inner duct; laVIII = laterotergites VIII; laIX = laterotergites IX; md = median duct of vesicular area; od = outer duct of vesicular area; pi = pars intermedialis; tgIX = secondary thickening of gonapophyses IX; vi = thickening of vaginal intima; X = segment X. Scale bars: A–B = 1 mm; C–D = 0.5 mm.

[as Abyssinia], Gabon, Ivory Coast [as Grand Bassam], Nigeria [as Benue Niger], Sierra Leone, South Sudan, Sudan, Tanzania [as Usambara and Kilimanjaro] (Schouteden 1905a), Kenya [as Leito-kitok] (Schouteden 1910), Mali [as Koulakoro] (Vuillet & Vuillet 1911), Guinea-Bissau (Schouteden 1913b), Namibia [as Damaraland, Otjiwarongo and Tsumeb] (Hesse 1925), Uganda (Carpenter 1926), Somalia (Mancini 1937), Cape Verde Islands (Lindberg 1958 or 1959?), Chad (Couilloud 1989), Yemen (Linnauori 1989), Angola, Botswana, Gambia, Liberia (Thomas 1994), Malawi (Sileshi *et al.* 2000), Zambia (Sileshi *et al.* 2001), Republic of Djibouti, Togo (Maldès & Pluot-Sigwalt 2004), Republic of the Congo [as Haut Oubangui?] (Maldès & Pluot-Sigwalt 2004; also in Robertson 2009 as “Congo Brazz.”), Niger (Robertson 2009; in error?), Canary Islands (new record) (Table 1, Fig. 1).

Remarks

Intraspecific variability in the colour and general morphology has been demonstrated for *A. (Afrius) purpureus* (e.g., Linnauori 1989; Schouteden 1905a; Van Heerden 1931; Villiers 1952b) as well as for other pentatomids, such as *Nezara viridula* (Linnaeus, 1758) (e.g., Freeman 1940; Kiritani 1970; Ohno & Alam 1992; Vivan & Panizzi 2002; More *et al.* 2017) and *Stiretrus decemguttatus* (Lepeletier & Serville, 1828) (Paleari 2013) for colour pattern, and *Pinthaeus sanguinipes* (Fabricius, 1781) for variation in the pronotum, reported by Zhao *et al.* (2013). Besides, we could not find any connection between the polymorphism and the geographic distribution of *A. (Afrius) purpureus*, i.e., specimens that we have examined, despite different colour patterns and pronotum shapes, are sympatric. The localities where they were collected are denoted by the green dots on Fig. 1.

There has been considerable difference of opinion regarding the name used for this species, i.e., either *yolofa/-us*, *purpurea/-us* or *figurata/-us* and, sometimes, the latter used as a variety or subspecies of the second one (see review of the taxonomic history of the species above). Dallas (1851) was the first to synonymize *figuratus* and *yolofa*; he stated the date of publication of *Pentatoma yolofa* as 1830, while Stål (1864) stated it as 1829. Subsequent authors (including Stål 1870) accepted 1838 as the year of publication for *yolofa* and therefore they recognized either *figuratus* or *purpureus* as the valid name, Wallengren (1875) may have been the last author to use *yolofa* (misspelled as *Ylofa*) as a valid name while Larousse (1890) gave a brief description of it under the genus *Canthecona* (strangely, this entry first mentions that the type species of *Canthecona* is from Senegal and thereafter describes *C. yolofa*, as though implying it were the type species; the type species of *Canthecona* Amyot & Serville, 1843 is, however, *C. discolor* (Palisot de Beauvois, 1811), described from the Kingdom of Oware, now Southwest Nigeria). Dupuis (1952) demonstrated the priority of *Pentatoma yolofa* Guérin-Ménéville, 1831 over *Pentatoma purpurea* Westwood, 1837 and *Asopus figuratus* Germar, 1838. Thomas (1994) adopted the combination suggested by Dupuis (1952), *Afrius yolofus*. This was, as well, used by subsequent authors (Maldès & Pluot-Sigwalt 2004; Rebagliati *et al.* 2005; Kerisew 2011). Some others (Sileshi *et al.* 2001, 2004; Kerzhner *et al.* 2004; Rider 2006; Robertson 2009; Matesco *et al.* 2014), however, chose the combination *Afrius yolofa*, while others again still used *purpureus* and/or *figuratus* after 1952 (e.g., Mancini 1953; Villiers 1954, 1956; Leston 1954; Lindberg 1958; Schouteden 1963, 1964; Gillon 1972; Linnauori 1975, 1976, 1982; Bourdouxhe & Jolivet 1981; Nuamah 1982; Matanmi & Hassan 1987; Balsbaugh 1988; Couilloud 1989; Quicke *et al.* 1992; Schaefer 1996; Tchibozo & Braet 2004; Poutouli *et al.* 2011; Agboton *et al.* 2014; Crétenet & Gourlot 2015) and yet others treated *figuratus* as a variety or a subspecies of *purpureus* (Schouteden 1905a, 1907a; Kirkaldy 1909; Schouteden 1909; Mancini 1937; Le Pelley 1959; Linnauori 1989). Others still have used two or three combinations in the same work, possibly because they were reporting facts from primary sources, using the names as they were in the sources, and were not aware that the species were the same (Le Pelley 1959; Schaefer 1996).

The different combinations used for one and the same species clearly are the results of a few misconceptions: when and how *yolofa*, *figuratus* and *purpureus* were synonymized, the problematic dating of *yolofa* and *figuratus* and the status of *yolofa* as an adjective or a noun in apposition.

Synonomies of *yolofa*, *figuratus* and *purpureus*

Earlier we noted that Dallas (1851) first stated the synonymy of *figuratus* with *yolofa*. Clearly, Stål (1870) and Schouteden (1905a) believed *yolofa* sensu Dallas (1851) was a misidentification, pertaining to *figuratus*. *Pentatoma yolofa* was synonymized with *Cimex (Afrius) purpureus* by Stål (1870). *Asopus figuratus* was considered as a variety of *Canthecona purpurea* by Schouteden (1905a). It appeared as a junior synonym of *Afrius yolofus* together with *Pentatoma purpurea* in Dupuis (1952). Later, Leston (1954) made use of it as the valid name of the species; yet, in a footnote, it was corrected that the valid name should be *Afrius yolofus*. Additionally, the confusion between the use of *figuratus* and *purpureus* has been so great that some authors have even attributed the authorship of *purpureus* to Germar (e.g., Risbec 1950; Herting 1971, 1976). Considering the above, it is no surprise that *figuratus* appeared as a variety or subspecies of *purpureus*, even relatively recently. It is no surprise either that it still appeared as a valid name as late as 2000 (Sileshi *et al.* 2000) and possibly later, concurrently with the other names (*yolofa*, *yolofus* and *purpureus*).

Problematic dating of *yolofa* and *figuratus*

As stated above, until Dupuis (1952), *yolofa* had been considered as a junior synonym of *purpureus* as its date of publication was thought to be 1838. This actually is that of *figuratus*. For a long time there was considerable confusion about the priority of the works of Westwood (1837) and Germar (1838); the title pages of both works indicated 1837 as the date of publication. Schouteden (1907b) demonstrated that Westwood's work had priority. Sherborn (1922–1932) attributed the date “1840” to all taxa published by Germar in the fifth volume of the *Revue entomologique* (pages 121–192); most modern catalogues of Heteroptera list Germar's work with the date 1838 (e.g., Rolston *et al.* 1993; Schuh 1995; Aukema & Rieger (eds) 1995–2013; Rolston *et al.* 1996; Cassis & Gross 2002; CoreoideaSF Team 2018; Dellapé & Henry 2018). Recently, Nagel & Schmidlin (2014: 97) stated a precise date (21 November 1838) for taxa newly described between pages 1 to 224 of the fifth volume. As a consequence, *Pentatoma purpurea* Westwood, 1837 definitely has priority over *Asopus figuratus* Germar, 1838 [not 1837 as earlier authors had assumed], and *Pentatoma yolofa* Guérin-Méneville, 1831 over them both.

Should we use *yolofa*, a noun in apposition or *yolofus*, an adjective?

The original description indubitably shows that Guérin-Méneville chose an adjective and not a noun in apposition as may have been thought by recent authors who made use of the combination *Afrius yolofa*, possibly influenced by earlier authors (Amyot & Serville 1843; Dallas 1851).

Guérin-Méneville (1831: plate 55, 1844: 344) used the binomen *Pentatoma yolofa* with a lower case “y”, implying that the name was treated as an adjective (a capital “D” was used for *Scutellera Dives* and a capital “S” for *Tesseratoma* [sic] *Sonneratii* on the same plate, as one would expect in those days for a noun in apposition or a genitive based on the name of a person); the same author (Guérin-Méneville 1844: 344) also used the French vernacular name P[entatome] *yolofe*. Amyot & Serville (1843) cited this species as *Canthecona Yolofa* (with vernacular French as Canthécone *Yolofa*), using a capital “Y” in the Latin binomen (also followed by Dallas 1851), and a final “a” in the French name. Their use of a capital “Y” and of a final “a” in the French name indicates that these subsequent authors treated the species name as a noun in apposition.

The *Grand Dictionnaire Universel du XIX siècle* (Larousse 1876: 1423) has an entry for the adjective “YOLOF ou YOLOFF, OVE”, meaning “relative to the native language of the Wolof people (Senegal, Gambia, Mauritania)”. Although the adjective is there restricted to the field of linguistics and despite the fact that the proper feminine form of the adjective in French is “yolove”, it is clear that Guérin-Méneville (1831) meant to indicate that his *Pentatoma*, collected in Senegal, the land of the wolof/yolof people, was ‘yolove’ (expressed with an adjective), so he called it *Pentatome yolofe/Pentatoma yolofa*. Admittedly, this adjective has not been used much in zoology; Sherborn (1932: 7031) only lists one

other species having *yolofus* as its epithet, *Prionus yolofus* (Dalman, 1817) (Coleoptera: Cerambycidae: Prioninae: Acanthophorini). The latter species is now placed in the genus *Tithoes* Thomson, 1864, which contains two other species whose epithets equally express their rather precise African provenance: *Tithoes congolanus* (Lameere, 1903) and *T. somalius* (Lameere, 1903).

The precedence of *A. yolofo* over its synonyms, pointed out by Dupuis (1952) and echoed by Leston (1954), was generally ignored until Thomas (1994). Even now, few are those who apply it. In almost two centuries, a substantial number of papers on the species have been published using either *purpureus* or *figuratus*. Since *purpureus* has been the most used overall, since it was used continually to refer to this species since its publication and since *Afrius purpureus* is the name used in the latest publication on the species that we are aware of, we have used the name *Afrius purpureus* in this revision as the valid name. In addition, we intend to apply to the International Commission on Zoological Nomenclature, under Article 23.9.3 of the Code (ICZN 1999), so that the prevailing usage of the specific name *Pentatomia purpurea* Westwood, 1837 (currently *Afrius purpureus*) be conserved and ensured in future.

Discussion

The idea that insects can control agricultural pests is old, and the success of biological control has already been demonstrated in many countries (Caltagirone 1981; McFadyen 1998; Bellows 2001; Parra *et al.* 2002). The predatory stink bugs that make up the subfamily Asopinae are among the insects with potential use in biological control (Magistrali *et al.* 2014), but despite this, there are still few modern phylogenetic and taxonomic studies on this subfamily. The lack of taxonomic studies may result in great economic losses when controlling and controlled species are poorly identified (Zucchi 2002). In this work we revised an important genus of Asopinae for biological control, namely *Afrius* Stål, 1870 (Miller 1952; Sileshi *et al.* 2004), which is distributed throughout Africa and adjacent islands and comprises, after this revision, three species: *Afrius (Subafrius) flavirostrum* (Signoret, 1861), *Afrius (Afrius) kollerii* Schouteden, 1911 and *Afrius (Afrius) purpureus* (Westwood, 1837). The contributions presented here could serve in future phylogenetic and taxonomic studies, as well as in applied agronomical sciences.

We maintained the two subgenera which were proposed by Schouteden (1907a) as they show distinct characteristics, such as the absence of abdominal glandular patches on males of *Afrius (Subafrius) flavirostrum* and the parameres which are divided into two rami in the same species. Perhaps a phylogenetic scenario including other similar genera can better substantiate this classification in the future.

We demonstrated in this study the importance of consulting type materials in taxonomy. For example, Miller (1952) had probably not seen the type material of *A. (Subafrius) flavirostrum* when he described the new species *A. williamsi* Miller, 1952, which we are synonymizing here. Furthermore, we strongly recommend the study of the external and internal morphology of the genitalia in Asopinae, as these were crucial here to the delimitation of species, especially of *Afrius (Afrius) purpureus*, which shows a broad geographical distribution and different patterns of general morphology and colour (Linnauvori 1989; Schouteden 1905a; Van Heerden 1931; Villiers 1952b).

We cannot hypothesize the relationship of the species of *Afrius* without a phylogenetic study, and at present we do not know if the genus is monophyletic. *Afrius (Afrius) kollerii* and *A. (A.) purpureus* seem to be more closely related to each other than to *A. (Subafrius) flavirostrum* based on similar male genitalia, i.e., the presence of vesica microsculptures and the presence of male abdominal glandular patches.

Afrius (Afrius) purpureus is a species with a broad geographical distribution and a great intraspecific variability with respect to size, morphology of the head and pronotum, and colour pattern (Figs 8–9).

Because of the observed differences we consider the morphology of the genitalia crucial to delimit the species of *Afrius*.

Acknowledgements

Herbert Zettel, Harald Bruckner (NHMW, Vienna) and Gunvi Lindberg (NHRS, Stockholm) sent images of types and their labels as well as other information about them. Dominique Pluot-Sigwalt (MNHN, Paris) and Angela Thresher (NHMUK, London) helped us to obtain important references. Jürgen Deckert (MFNB, Berlin), Jérôme Constant (Royal Belgian Institute of Natural Sciences, Brussels), Stéphane Hanot (RMCA, Tervuren), Eric Guilbert (MNHN, Paris) and Amoret Spooner (OUMNH, Oxford) received the first author in their collections and provided material for this study. Randall T. Schuh and Ruth Salas (AMNH, New York), David A. Rider (North Dakota State University, Fargo), Kurt Arnold (Entomologisches Museum - Insekten Dauerausstellung, Geyer), and Petr Kment (NMPC, Prague) also provided material for this study. Luiz Alexandre Campos (UFRG, Porto Alegre) made suggestions regarding the terminology of genitalia structures. We thank them all. We also thank Anna Namyatova (Saint Petersburg University, Saint Petersburg), Jocélia Grazia (UFRG, Porto Alegre), and Dávid Rédei (Nankai University, Tianjin), whose helpful comments improved our manuscript. We are particularly grateful to CAPES (Brazil) for having funded the research of TR under fellowship grant PDSE - 88881.133880/2016-01.
