Abstract. Based on intensive collecting from various sites in Sweden, the genus *Dasyhelea* Kieffer, 1911 was reviewed and the number of species now known from the country increased from five to twenty. Among the new species recorded there are two species described as new to science, *D. dominiakae* sp. nov. and *D. gotlandica* sp. nov., both in the subgenus *Dicryptoscena* Enderlein, 1936. The following subgenera are now documented from Sweden: *Dasyhelea*, *Dicryptoscena*, *Pseudoculicoides* Malloch, 1915, *Prokempia* Kieffer, 1913 and *Sebessia* Remm, 1979, the two latter subgenera being reported for the first time.

Keywords. Biting midges, taxonomy, systematics, new species, Malaise trap.

Introduction

The genus *Dasyhelea* Kieffer, 1911 is classified in the subfamily Dasyheleinae Lenz, 1934 and is cosmopolitan in distribution. More than 600 *Dasyhelea* species are known, representing one-tenth of all described Ceratopogonidae species in the World (Borkent 2015). The highest diversity is described from large countries in the northern hemisphere, i.e., China, USA and Russia (Borkent 2015). The immature stages of *Dasyhelea* inhabit a wide range of moist and terrestrial habitats, like peat bogs (Domniak & Szadziewski 2006), rockpools (Wirth 1978), plants of *Nepenthes* Linnaeus (Wirth & Beaver 1979), tree sap (Domniak 2005) and in mushrooms (Graves & Graves 1985). The short-lived adults (Zilahi-Sebess 1931) are often found in or around the vegetation near the breeding sites (Waugh & Wirth 1976). The structure of the mouthparts in both sexes is similar, i.e., reduction of both mandibles and maxillae (Glukhova 1981), and both males and females feed on nectar and honeydew and according to Wirth (1956) they can act as pollinators of plants such as rubber trees (*Hevea brasiliensis* (Willd. ex Adr. Juss.)).

The most recently described ceratopogonid species from Sweden, which are still valid, are *Forcipomyia squamigera* Kieffer, 1916 and *Bezzia pilipennis* Lundström, 1916. Reports thereafter added more species
records for the country, resulting in a record list of approximately one hundred species of Ceratopogonidae for Sweden (Rehnberg & Brodin 2010; Nielsen et al. 2010; Szadziewski et al. 2012). This may be compared to 184 species in Estonia, 211 in Poland and 256 in Germany (Szadziewski et al. 2012), which indicates that Sweden might have been undersampled historically compared to some other countries. Efforts were therefore made in order to more carefully examine the Swedish diversity using recently trapped material from various sites. The Swedish Dasyhelea include five species previously recorded from Sweden: D. pallidiventris (Goetghebuer, 1931), D. corinneae Gossseries, 1991, D. turficola Kieffer, 1925, D. modesta (Winnertz, 1852) and D. notata Goetghebuer, 1920 (Dominiak & Szadziewski 2010). With this report the number of Dasyhelea species in Sweden increases to 20, a low number compared to the more than 60 species recorded from the rest of Europe (Szadziewski et al. 2012).

Material & Methods

The specimens in this study were collected from Djäknabygds Bokbacke during the summer of 2005, from Limhmans kalkbrott (limestone quarry) during the summer of 2009, and various other localities in Sweden during the spring and summer of 2011. Specimens were collected in Malaise traps and in sweep nets. At the lab they were stored in 80% ethanol in deep freezers. After sorting and preliminary identification, the whole body was cleared using Proteinase K as part of DNA extraction and sequenced for mitochondrial cytochrome I (COI) according to the methods described in Strandberg & Johanson (2010). The COI sequences were used to associate males and females using MEGA 5.2.2 (Tamura et al. 2011), applying the settings in Stur & Borkent (2014). The head, wings and abdomen/genitals from the thorax and one leg from each leg pair were mounted under separate cover slips on microscope slides using Euparal as permanent mounts. Specimens from Limhamns kalkbrott and Bunkeflostrand are stored at the Museum of Zoology, Lund University, Sweden (MZLU) while the rest are deposited at the Department of Zoology, Swedish Museum of Natural History (NHRS).

In the descriptions, specimens were measured for each character and ratios and measurements of the antennae (AR), palpi (PR (III)), wings and costal vein (CR) were obtained following the methods described by Dominiak (2012). Measurements are given for the holotype as well as the range of variation in each character for the paratypes (n = number of specimens examined).

Results

Class Insecta Linnaeus, 1758
Order Diptera Linnaeus, 1758
Family Ceratopogonidae Newman, 1834
Subfamily Dasyheleinae Lenz, 1934
Genus Dasyhelea Kieffer, 1911

Dasyhelea Kieffer, 1911: 5. Type species: Dasyhelea halophila Kieffer, 1911: 5 (by monotypy).

Subgenus Dasyhelea

Dasyhelea bensoni Edwards, 1933
Dasyhelea vernalis Remm, 1979: 56.

New record
Distribution
Great Britain, Norway, Estonia, Romania, Russia (Amur Oblast, Yakutia) (Dominiak & Szadziewski 2010).

Biology
Specimens were collected on mire close to a lake during mid June. Previously *D. bensoni* has been collected from the end of May to mid July (Edwards 1933; Remm 1979).

*Dasyhelea (Dasyhelea) bilineata* Goetghebuer, 1920

*Dasyhelea bilineata* Goetghebuer, 1920: 45.
*Dasyhelea insignipalpis* Kieffer, 1925a: 62 (as *D. versicolor* var. *insignipalpis*).
*Dasyhelea montana* Zilahi-Sebess, 1940: 48 (as *D. dufouri* var *montana*).
*Culicoides dieuzeidei* Vaillant, 1957: 265.

New record
SWEDEN: 1 ♂, 1 ♀, Malmö, Bunkeflostrand, Malaise trap, 16 Jul.–1 Aug. 2009, leg. B.W. Svensson (MZLU).

Distribution
Norway, Finland, Russia, Estonia, Great Britain, Ireland, Belgium, Germany, Poland, Czech Republic, Slovakia, France, Switzerland, Austria, Italy, Croatia, Hungary, Romania, Ukraine (Crimea), Bulgaria, Spain, Gibraltar, Algeria, Turkey (Dominiak & Szadziewski 2010).

Biology
The specimens were collected in an area with shore meadows on the west coast in the south of Sweden. The larva inhabits shallow water bodies; both natural and artificial and preimaginal stages are very tolerant of desiccation and temperature fluctuations (Zilahi-Sebess 1931; Valkanov 1941; Disney 1975).

Remarks
The male keys out as *D. bilineata* in Dominiak (2012). The associated female has the subgenital plate with broad lateral processes and a more hearth-shaped notum in contrast to the isosceles triangular-shaped notum of *D. bilineata* shown in Dominiak (2012).

*Dasyhelea (Dasyhelea) caesia* Remm, 1993

New record
**Distribution**
Russia (Leningrad Oblast, Yakutia), Poland (Dominiak & Szadziewski 2010).

**Biology**
The specimen was collected in a marsh situated between two lakes with water flowing through. Last instar larvae and pupae of *Dasyhelea caesia* have previously been collected from a small body of water and the littoral zone of lakes in Russia during July (Brodskaya 1995; Przhiboro 2005).

*Dasyhelea (Dasyhelea) malleola* Remm, 1962

**New records**

**Distribution**
Estonia, Norway, Germany, Poland, Czech Republic, Ukraine (Crimea), Spain, Andorra, Algeria (Dominiak & Szadziewski 2010; Stur & Borkent 2014).

**Biology**
Specimens were collected on mire next to a lake from the beginning of June to the beginning of July.

*Dasyhelea (Dasyhelea) flavifrons* (Guérin, 1833)

*Ceratopogon flavifrons* Guérin, 1833: 165.
*Ceratopogon obscurus* Winnertz, 1852: 45.
*Ceratopogon versicolor* Winnertz, 1852: 45.
*Ceratopogon dufouri* Laboulbène, 1869: 158.
*Ceratopogon hippocastani* Mik., 1888: 185.
*Ceratopogon rufithorax* Strobl, 1920: 261 (as *C. versicolor* var. *rufithorax*).
*Dasyhelea brevitibialis* Goetghebuer, 1919: 72.
*Dasyhelea goetghebueri* Kieffer, 1919: 53.
*Dasyhelea sensuialis* Kieffer, 1919: 55.
*Dasyhelea lignicola* Kieffer, 1919: 57.
*Dasyhelea paludicola* Kieffer, 1925b: 152.
*Dasyhelea septuosa* Borkent *in* Borkent & Wirth, 1997: 58 (new name for *D. obscura* (Winnertz, 1852)).

**New record**
Distribution
Estonia, Great Britain, Belgium, Germany, Poland, Czech Republic, France, Austria, Switzerland, Spain, Croatia (Istria), Greece (Crete), Bulgaria, Ukraine (Crimea), Russia (Karachay-Cherkessia), USA (Dominiak & Szadziewski 2010).

Biology
Larvae of D. flavifrons can be found in tree sap or tree holes. Flight period May–October (Dominiak 2012).

Remarks
The previous listing of this species as present in Sweden is doubtful as it has only been reported in Rehnberg & Brodin (2010), based on D. versicolor (Winnertz, 1852) as listed in Szadziewski et al. (1997). We were unable to verify previous records.

Dasyhelea (Dasyhelea) pallidiventris (Goetghebuer, 1931)

Tetraphora pallidiventris Goetghebuer, 1931: 211.

Distribution
Sweden, Finland, Estonia, Lithuania, Germany, Poland, Czech Republic, Ukraine (Crimea), Georgia, Azerbaijan, North Korea (Dominiak & Szadziewski 2010).

Biology
Dasyhelea pallidiventris is considered a haloxene, and the larvae inhabit inland saline habitats and the littoral zone of lakes (Szadziewski 1983). Previously recorded from Norrtälje in east-central Sweden (Dominiak & Szadziewski 2010).

Subgenus Prokempia Kieffer, 1913

Dasyhelea (Prokempia) biunguis Kieffer, 1925

Dasyhelea biunguis Kieffer 1925c: 409.

New record

Distribution
Great Britain, Norway, Estonia, Russia (Kaliningrad Oblast) (Dominiak & Szadziewski 2010).

Biology
Specimens collected on a heath with old beeches.
Dasyhelea (Prokempia) dampfi Kieffer, 1925

Dasyhelea dampfi Kieffer, 1925b: 150.
Dasyhelea turfacea Kieffer, 1925b: 151.
Dasyhelea estonica Kieffer, 1925c: 409.

New record

Distribution
Estonia, Lithuania, Poland, Czech Republic (Dominiak & Szadziewski 2010).

Biology
This specimen was collected at a peat bog in the beginning of August.

Subgenus Pseudoculicoides Malloch, 1915

Pseudoculicoides Malloch, 1915: 309. Type species: Ceratopogon mutabilis Coquillet, 1901: 602 (by original designation).

Dasyhelea (Pseudoculicoides) arenivaga Macfie, 1943

Dasyhelea inconspicuosa var. arenivaga Macfie, 1943: 151.

New records

Distribution
Poland, Czech Republic, Switzerland, Romania, Ukraine (Crimea), Bulgaria, Spain, Algeria, Egypt, Israel, United Arab Emirates (Dominiak & Szadziewski 2010; Szadziewski et al. 2011).

Biology
These specimens were collected in a marsh and in a seasonally flooded area next to a lake. D. arenivaga is known to visit umbelliferous and tamarisk flowers (Dominiak & Szadziewski 2010).

Dasyhelea (Pseudoculicoides) calycata Remm, 1972

New record

Distribution
Great Britain, Lithuania, Poland, Slovakia, Bosnia and Herzegovina, Ukraine (Crimea), Romania, Bulgaria, Spain, Hungary, Russia (North Ossetia, Tuva, Buryatia), Mongolia (Dominiak & Szadziewski 2010).
Biology
The specimens were collected in a small village garden. Larvae can be found in both fresh and salt-water habitats and are common on inland saline meadows in Poland (Dominiak 2012).

Remarks
The association of the sexes made by Remm (1972) has previously been considered incorrect. The associated female probably belongs to D. unguistyla Remm, 1972 (Dominiak & Szadziewski 2010). The female associated in this study by COI sequences differs from the original description in lacking long cerci and in having a subgenital plate with a lumen. According to Dominiak & Szadziewski (2010) the type material is unavailable.

*Dasyhelea (Pseudoculicoides) corinneae* Gossseries, 1991

*Ceratopogon scutellatus* Meigen, 1830: 262.
*Dasyhelea corinneae* Gossseries, 1991: 42 (new name for *D. scutellatus* Meigen, 1830).
*Dasyhelea chonetus* Yu & Zou in Yu et al., 2006: 279.

Distribution
Great Britain, Sweden, Poland, Hungary, Ukraine, Russia (North Ossestia, Ussuri Land), China, North Korea, Canada, USA (Dominiak & Szadziewski 2010).

Biology
The only specimen recorded from Sweden was collected at Antjärn in August (Dominiak & Szadziewski 2010).

*Dasyhelea (Pseudoculicoides) europaea* Remm, 1962

*New records*

Distribution
Norway, Estonia, France, Czech Republic (Dominiak & Szadziewski 2010).

Biology
Specimens collected on mire in the north of Sweden and from the vegetation in a marsh in the southeast of Sweden. It is reported as a spring–summer species, most common between May and June (Remm 1962).

*Dasyhelea (Pseudoculicoides) turficola* Kieffer, 1925

*Dasyhelea turficola* Kieffer, 1925a: 15.
*Dasyhelea grenieri* Clastrier, 1966: 703.
*Dasyhelea malibui* Yu, 2008: 165.
Distribution

Great Britain, Ireland, Sweden, Estonia, Lithuania, Russia (Kaliningrad Oblast, Ussuri Land), Poland, Czech Republic, Belgium, France, Spain (Iberian Peninsula, Canaries: Tenerife), Georgia, Morocco, Algeria, Israel (Dominiak & Szadziewski 2010).

Biology

*Dasyhelea turficola* larvae are known to inhabit peat bogs and moist soil close to fresh and salt-water bodies. Adults of the species visit umbelliferous flowers (Dominiak 2012). Previously, *D. turficola* have been collected in Johannisfors (Dominiak & Szadziewski 2010).

Subgenus *Dicryptoscena* Enderlein, 1936

*Dicryptoscena* Enderlein, 1936: 51. Type species *Dasyhelea inclusa* Kieffer, 1918: 188 (by original designation).

*Dasyhelea (Dicryptoscena) modesta* (Winnertz, 1852)

*Ceratopogon modestus* Winnertz, 1852: 43.
*Ceratopogon aestivus* Winnertz, 1852: 42.
*Dasyhelea longipalpis* Kieffer, 1913b: 37.
*Dasyhelea inclusa* Kieffer, 1918: 188.
*Dasyhelea strobli* Kieffer, 1919: 63.
*Dasyhelea pratensis* Goetghebuer, 1920: 44.
*Dasyhelea bihamata* Kieffer, 1923: 667.

Distribution

Norway, Sweden, Russia (Karelia, Leningrad Oblast, North Ossetia), Estonia, Lithuania, Great Britain, Poland, Germany, the Netherlands, Belgium, Czech Republic, France, Switzerland, Austria, Hungary, Romania, Ukraine (Crimea), Bulgaria, Andorra, Spain, Georgia, Azerbaijan, Afghanistan, Iran, China, Japan, Algeria, Egypt, Yemen (Dominiak & Szadziewski 2010).

Biology

Preimaginal stages inhabit a wide range of aquatic and semiaquatic habitats and can be found in ponds, mud, swamps, peat bogs, the littoral zone of lakes and saline habitats (Thienemann 1915, 1950; Mayer 1934; Szadziewski 1986; Przhiboro 1999; Chandler et al. 2008).

*Dasyhelea (Dicryptoscena) notata* Goetghebuer, 1920

*Dasyhelea notata* Goetghebuer, 1920: 47.
*Dasyhelea semistriata* Goetghebuer, 1921: 176.
*Dasyhelea sziladyi* Zilahi-Sebess, 1936: 42.

Distribution

Sweden, Finland, Estonia, Lithuania, Poland, Belgium, France, Switzerland, Czech Republic, Hungary, Romania, Spain, Georgia, Russia (Ussuri Land), North Korea, Algeria (Dominiak & Szadziewski 2010).
Biology

Adults of this species are known to visit umbelliferous flowers (Dominiak 2012).

*Dasyhelea (Diryptoscena) stellata* Remm, 1968

**New record**

**Distribution**

Great Britain, Poland, France, Czech Republic, Ukraine (Crimea), Russia (North Ossetia) (Dominiak & Szadziewski 2010).

**Biology**

These specimens were collected close to a pond in an old limestone quarry in the south of Sweden.

*Dasyhelea (Dicryotoscena) thienemanni* Spâtaru & Damian-Georgescu, 1970

**New records**

**Distribution**

Estonia, Lithuania, Poland, Slovakia, Hungary, Romania, Bulgaria, Georgia, Azerbaijan (Dominiak & Szadziewski 2010).

**Biology**

The specimens were collected from a small peat-bog in the middle-east of Sweden and from an old limestone quarry in the south of Sweden. Preimaginal stages have previously been found in and around a spring (Spâtaru & Damian-Georgescu 1970).

*Dasyhelea (Dicryotoscena) dominiakae* sp. nov.

urn:lsid:zoobank.org:act:956852B2-A7AD-46A6-A238-0F8B55540915

Figs 1–11

**Diagnosis**

The male resembles those of *D. notata* in the morphology of the genitalia, particularly by the presence of a pair of horn-like projections on the posterior margin of sternite 9. It is distinguished from *D. notata* in having an additional triangular projection on each lateral side of the posterior margin of sternite 9.

**Etymology**

This species is named after Dr. Patrycja Dominiak for her contributions to our knowledge of European Ceratopogonidae, notably the *Dasyhelea*.
Type material

Holotype

Paratypes

Description

Male
HEAD (Figs 1–5). Antennal flagellum length 717 μm (697–747 μm, n = 4); AR 1.15 (1.0–1.28, n = 4) (Fig. 2). Frontal sclerite rhomboid (Fig. 3). Clypeus entire, with 12 (11–12, n = 4) long setae (Fig. 4). Palp segment 3 slender, 95 μm (95 μm, n = 4); PR (III) 5.4 (4.75–6.3, n = 4); first half with hyaline sensillae on inner surface (Fig. 5).

THORAX (Figs 6–7). Scutellum pale, with 12 bristles (8–11, n = 4). Wing length 1.15 mm (1.02–1.17 mm, n = 4); CR 0.45 (0.46–0.52, n = 4); macrotrichia numerous (Fig. 6); first radial cell slit-like, second cell open (Fig. 7). Legs brown, except tarsi pale brown.

GENITALIA (Figs 8–11). Apicolateral process of tergite 9 short, with five short bristles. Posterior margin of sternite 9 with triangular projection on each lateral side and a pair of horn-like projections. Gonostylus straight, basally broad, apically slender, proximal part covered by small setae, two long bristles at midpoint present (Figs 8–9). Parameres asymmetrical. Posterior process of parameres fused to right arm, tapering evenly along its length, evenly curved dorsad (Fig. 10). Aedeagus high arched, with apicolateral processes twisted along its length, tapering apically (Fig. 11).

Female
Unknown.

Remarks
Dasyhelea dominiakae sp. nov. is a member of the subgenus Dicryptoscena and is similar to D. notata and D. modesta. What distinguishes this species from those mentioned above, as well as other European species of Dicryptoscena, is the presence of triangular projections located on sternite 9. The male of D. dominiakae sp. nov. further differs from D. notata in having an evenly shaped posterior process and it is also separated from D. modesta by the equal length of the fourth and fifth palpal segments.

Biology
The holotype and paratypes were collected with Malaise traps in an old limestone quarry in the south of Sweden during May–June, among Salix caprea Linnaeus next to a pond.

Dasyhelea (Dicryptoscena) gothlandica sp. nov.
urn:lsid:zoobank.org:act:5FCC2057-325D-4EFF-B0F9-0C660A747422
Figs 12–32

Diagnosis
The male genitalic of this species are characteristic in having the posterior margin of sternite 9 with a pair of processes apically separated by a shallow furrow. Gonostyli short, tapering to an indented sharp point. The aedeagus has broad apicolateral processes, and the posterior process of the paramere has fine hairs apically.

Etymology
Gothlandica refers to Gotland, a calcareous island located in the Baltic Sea east of mainland Sweden, where the holotype was collected.

Type material
Holotype

Paratypes
Description

Male
Head (Figs 12–16). Antennal flagellum length 727 μm (687–727 μm, n = 4); AR 1.06 (0.97–1.19, n = 4) (Fig. 13). Frontal sclerite elliptical (Fig. 14). Clypeus entire, with 8 (6–8, n = 4) long setae (Fig. 15). Palp segment 3 slender, 90 μm (85–91 μm, n = 4); PR$_{III}$ 6.6 (6.3, n = 4) (Fig. 16); first half with hyaline sensillae on inner surface.

Thorax (Figs 17–18). Scutellum pale, with 10 bristles (9–10, n = 4). Wing length 1.15 (1.08–1.17 mm, n = 4); CR 0.45 (0.46–0.48, n = 4); macrotrichia numerous (Fig. 17); first radial cell slit-like, second cell open (Fig. 18). Legs light brown, tarsi paler.

Genitalia (Figs 19–22). Apicolateral process of tergite 9 short. Posterior margin of sternite 9 apically divided into pair of obtuse projections. Gonostylus short, tapering to indented sharp point, covered by small setae, two long bristles at midpoint present (Figs 19–20). Parameres asymmetrical; posterior process fused with right arm; long and slender, distinctly bent apically, with fine apical hairs (Fig. 21). Aedeagus low arched with apicolateral processes broad, somewhat folded, extended laterally in distal part (Fig. 22).

Female
Head (Figs 23–27). Antennal flagellum length 545 μm (444–525, n = 3); distal flagellomeres elongate; AR 0.96 (0.86–1.0, n = 3) (Fig. 24). Clypeus entire, with 8 (n = 3) long setae (Fig. 25). Frontal sclerite elliptical (Fig. 26). Palp segment 3 slender, 80 μm (80 μm, n = 4); PR_{(III)} 5.6 (5.3, n = 3) (Fig. 27); with hyaline sensillae at basal part of inner surface.

Thorax (Figs 28–29). Scutellum pale, with 8 bristles (9–10, n = 3). Wing length 1.1 mm (1.05–1.13, n = 3); CR 0.46 (0.44–0.47, n = 3) (Fig. 28). First radial cell slit-like, second cell open but small (Fig. 29). Legs as in male.

Genitalia (Figs 30–32). Subgenital plate with notum separated from ramus, slightly fragmented (Figs 30–31). Spermatheca single; ovoid-shaped with short neck; length × width: 60 × 40 μm (60 × 40 μm, n = 3) (Fig. 32).

Remarks
This species is a member of the subgenus Dicryptoscena, and the male is similar to that of Dasyhelea albidipes Santos Abreu, 1918 in the morphology of the genitalia, particularly by the presence of a pair of processes on the posterior margin of sternite 9. D. gothlandica sp. nov. differs from D. albidipes by the broadly shaped apicolateral processes and the short gonostyli.

Biology
The holotype was collected in a Malaise trap next to Lake Bästeträsk, with surrounding vegetation consisting of Pinus sylvestris Linnaeus and small shrubs. One of the male paratypes was collected in a Malaise trap next to Lake Horsan, approximately 5 km south-east of Bästeträsk.

Subgenus *Sebessia* Remm, 1979

*Sebessia* Remm, 1979: 55. Type species: *Dasyhelea flavopyga* Zilahi-Sebess, 1940: 49 (by original designation).

*Dasyhelea (Sebessia) acuminata* Kieffer, 1919

*Dasyhelea acuminata* Kieffer, 1919: 60.
*Dasyhelea polita* Edwards, 1921: 124.
*Dasyhelea verticillata* Kieffer, 1925a: 63.
*Dasyhelea littoralis* Goetghhebuer, 1934: 289.

**New records**

**Distribution**

Great Britain (Scotland), Estonia, Belgium, France, Czech Republic, Hungary, Bulgaria (Dominiak & Szadziewski 2010).

**Biology**

The male was collected next to a pasture and the females from the vegetation in a marsh.

**Discussion**

The two new species belong to the subgenus *Dicryptoscena* and together with the new records the Swedish *Dasyhelea* fauna now contains 20 species, representing the five subgenera, i.e., *Dasyhelea* (6 spp.), *Dicryptoscena* (5 spp.), *Prokempia* (2 spp.), *Pseudoculicoides* (6 spp.) and *Sebessia* (1 sp.). The number of *Dasyhelea* species in neighboring countries ranges from 8 for Finland (Huldén & Huldén 2014), to 11 for both Norway and Germany (Stur & Borkent 2014; Szadziewski et al. 2012), 12 for Lithuania, and 30 in both Estonia and Poland (Szadziewski et al. 2012). According to Peterson & Achim (2001) there are 4 species likely to occur in Denmark based on distributional patterns, and Remm (1988), without locality data, lists *Dasyhelea dampfi* as having a distribution that includes Latvia. Comparing the species composition between neighbouring countries, there are now six species present in Sweden that have also been reported from either Norway or Finland. The species *D. bensoni*, *D. bilineata* and *D. modesta* are present in all three countries. Sweden shares 13 species with Estonia and Poland of which 8 are present in all three countries (Szadziewski et al. 2012). *Dasyhelea flavoscutellata* (Zetterstedt, 1850) has not been recorded from Sweden but is present in all the countries mentioned above except Lithuania, Denmark and Latvia, and is therefore likely to live in Sweden as well. Most of the new records for Sweden have been collected from the southern parts of the country and only two records are from a northern locality (Muddus National Park). The diversity from a major part of Sweden is thus poorly known and could probably yield many more species. The substantial increase of *Dasyhelea* species in Sweden probably signals that the knowledge of *Dasyhelea* in particular and Ceratopogonidae in general is poor.

**Acknowledgements**

The authors are grateful for the help in identifications provided by Dr. Patrycja Dominiak and Dr. Ryszard Szadziewski at the Department of Invertebrate Zoology and Parasitology, University of Gdansk, Poland. For making material available for this study we are particularly indebted to Kajsa Glehmorn, Station
Linné, Öland, Sweden and the staff of the Museum of Zoology in Lund, Sweden. We are very thankful to Mr. Bertil Eklund, Gotland, Sweden and Mr. Hans Gustafsson, Gällivare, Sweden for emptying Malaise traps. We are much obliged for the assistance in the lab provided by Dr. Tobias Malm (NHRS). This study was funded by The Swedish Taxonomy Initiative (dha 157/09 1.4).
